

Modelling the present-day structure of the southern Norwegian lithosphere

Christophe Pascal

NGU, Geological Survey of Norway

TopoScandiaDeep meeting, Haraldvangen Jan. 21th 2009

Our contribution to TopoScandiaDeep

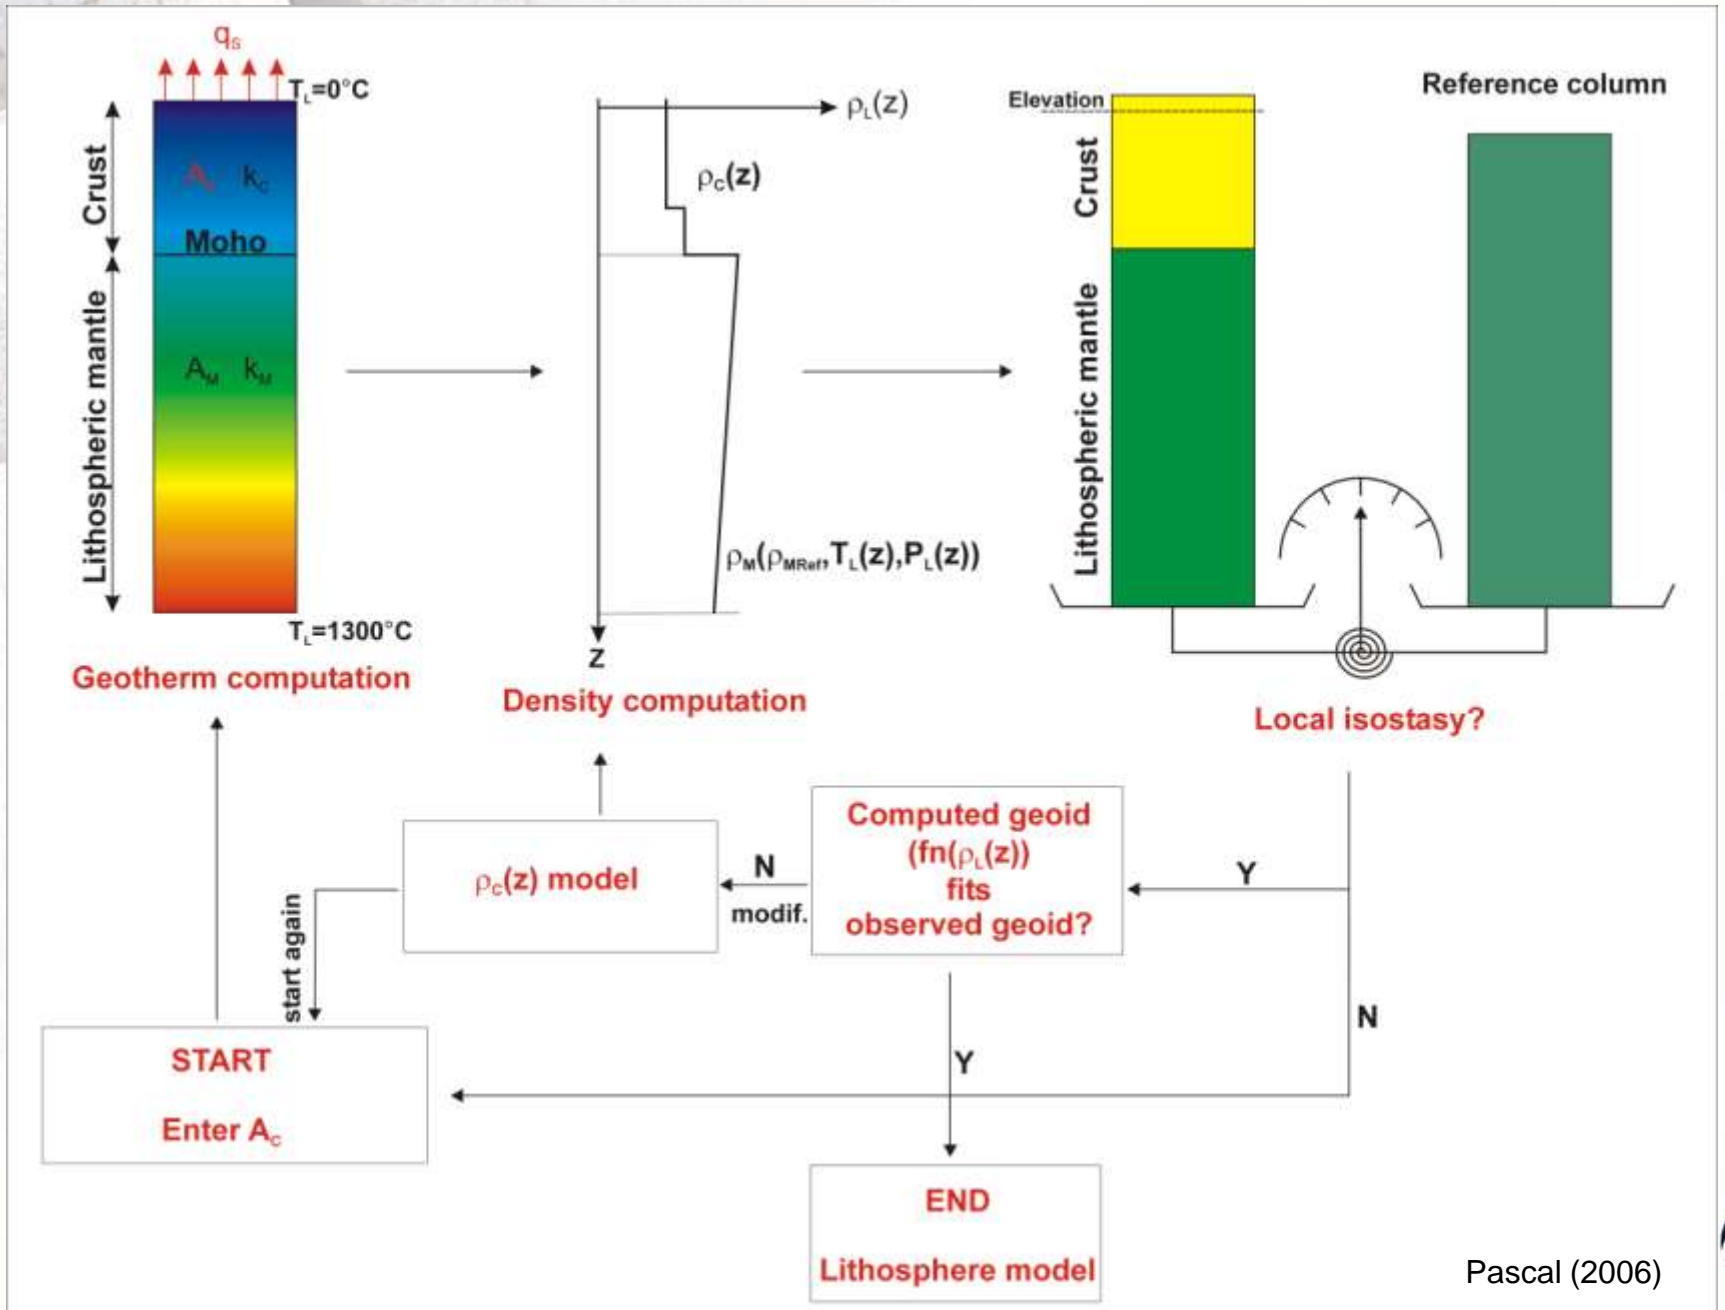

- To provide a thermal/rheological model of the lithosphere of southern Norway (and adjacent areas).
- To evaluate the role of the modelled lithosphere rheology on present-day stresses and seismicity.
- To furnish the model as starting point for further numerical modelling.

**Thermo-isostatic modelling of the
Fennoscandian lithosphere
Camille Raulin MSc thesis (2007)**

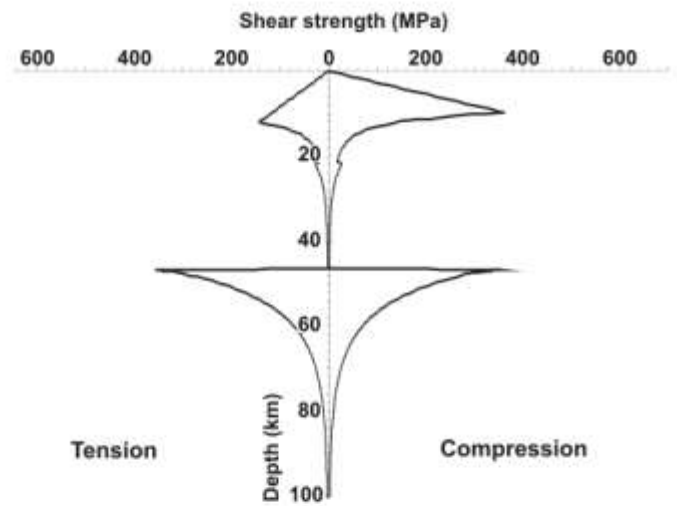

Method

Thermal structure

Rheology

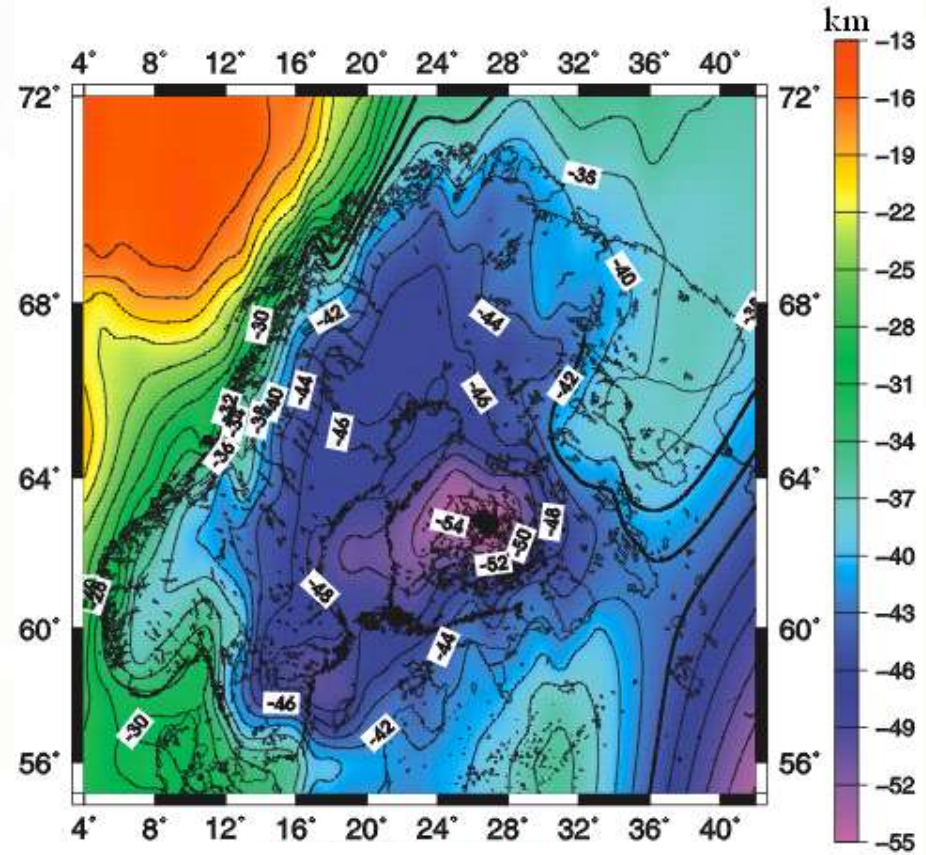

Input

1. Filtered topography

2. Moho depth (Kinck et al. 1993)

Input

3. Heat Flow (Pollack et al. 1993)

4. Crustal density model

RESULTS (MODEL 1, $\rho_c = 2830 \text{ kg/m}^3$)

Modelled geoid

Observed geoid
(Lemoine et al. 96)

MODEL 2: with high density lower crust (3000 kg/m³)

Pérez-Gussinyé et al. 2004

Ebbing 2004

HDLC thickness

RESULTS (MODEL 2)

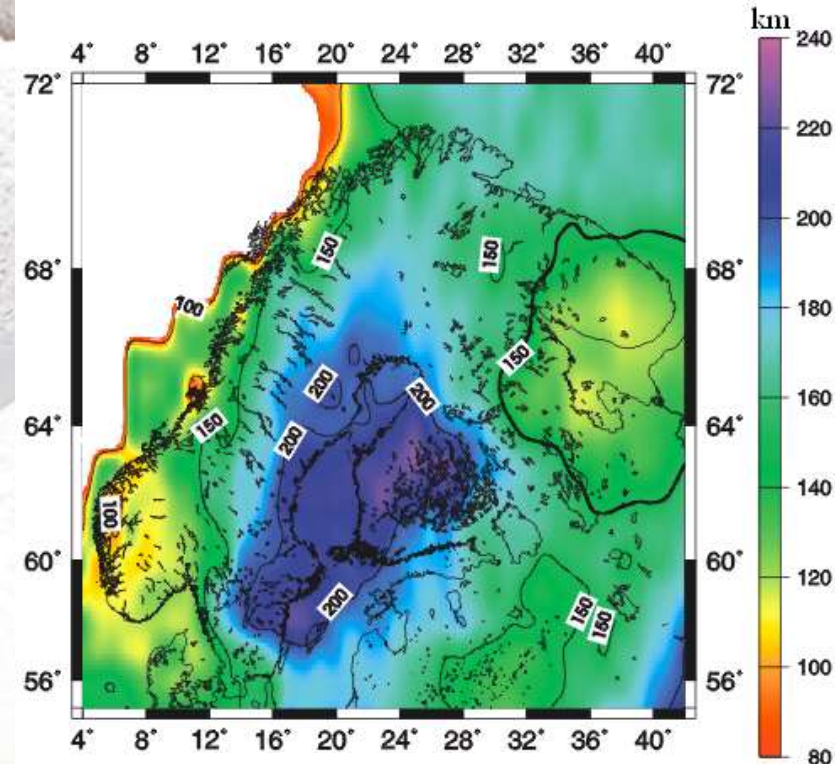

**Observed geoid
(Lemoine et al. 96)**

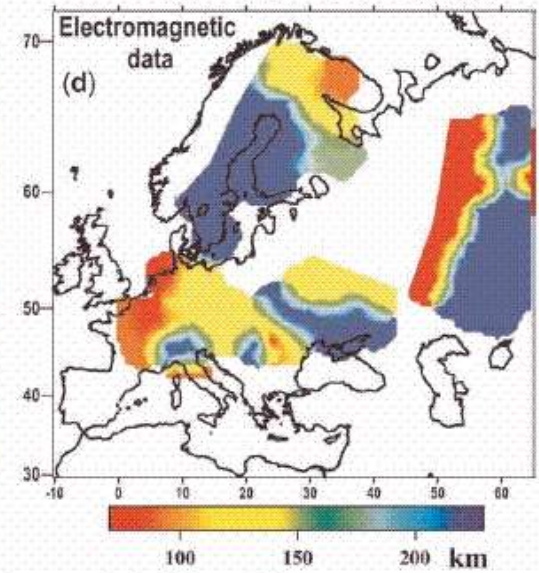

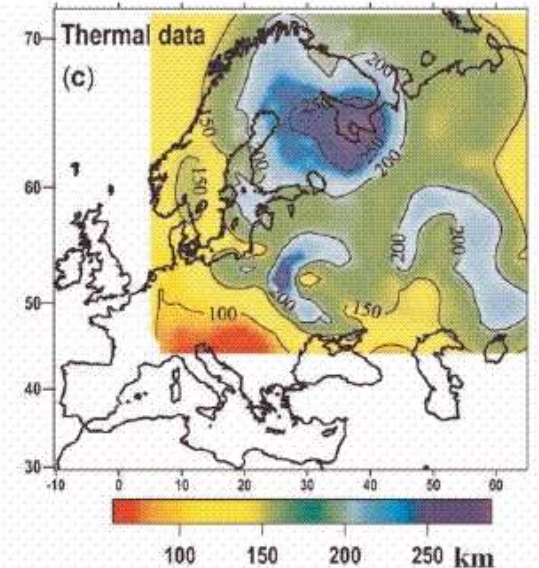

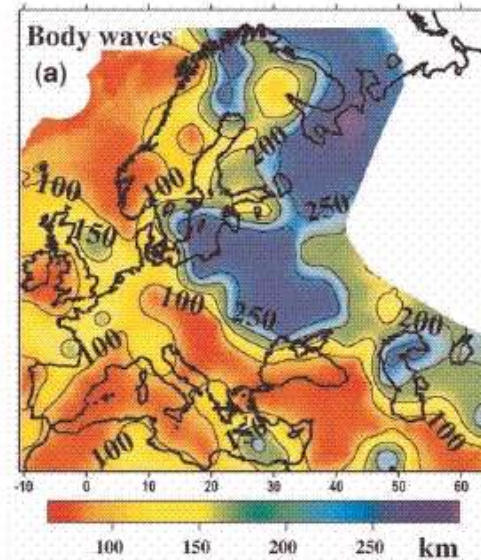

Modelled geoid

RESULTS (MODEL 2)

Modelled lithosphere thickness

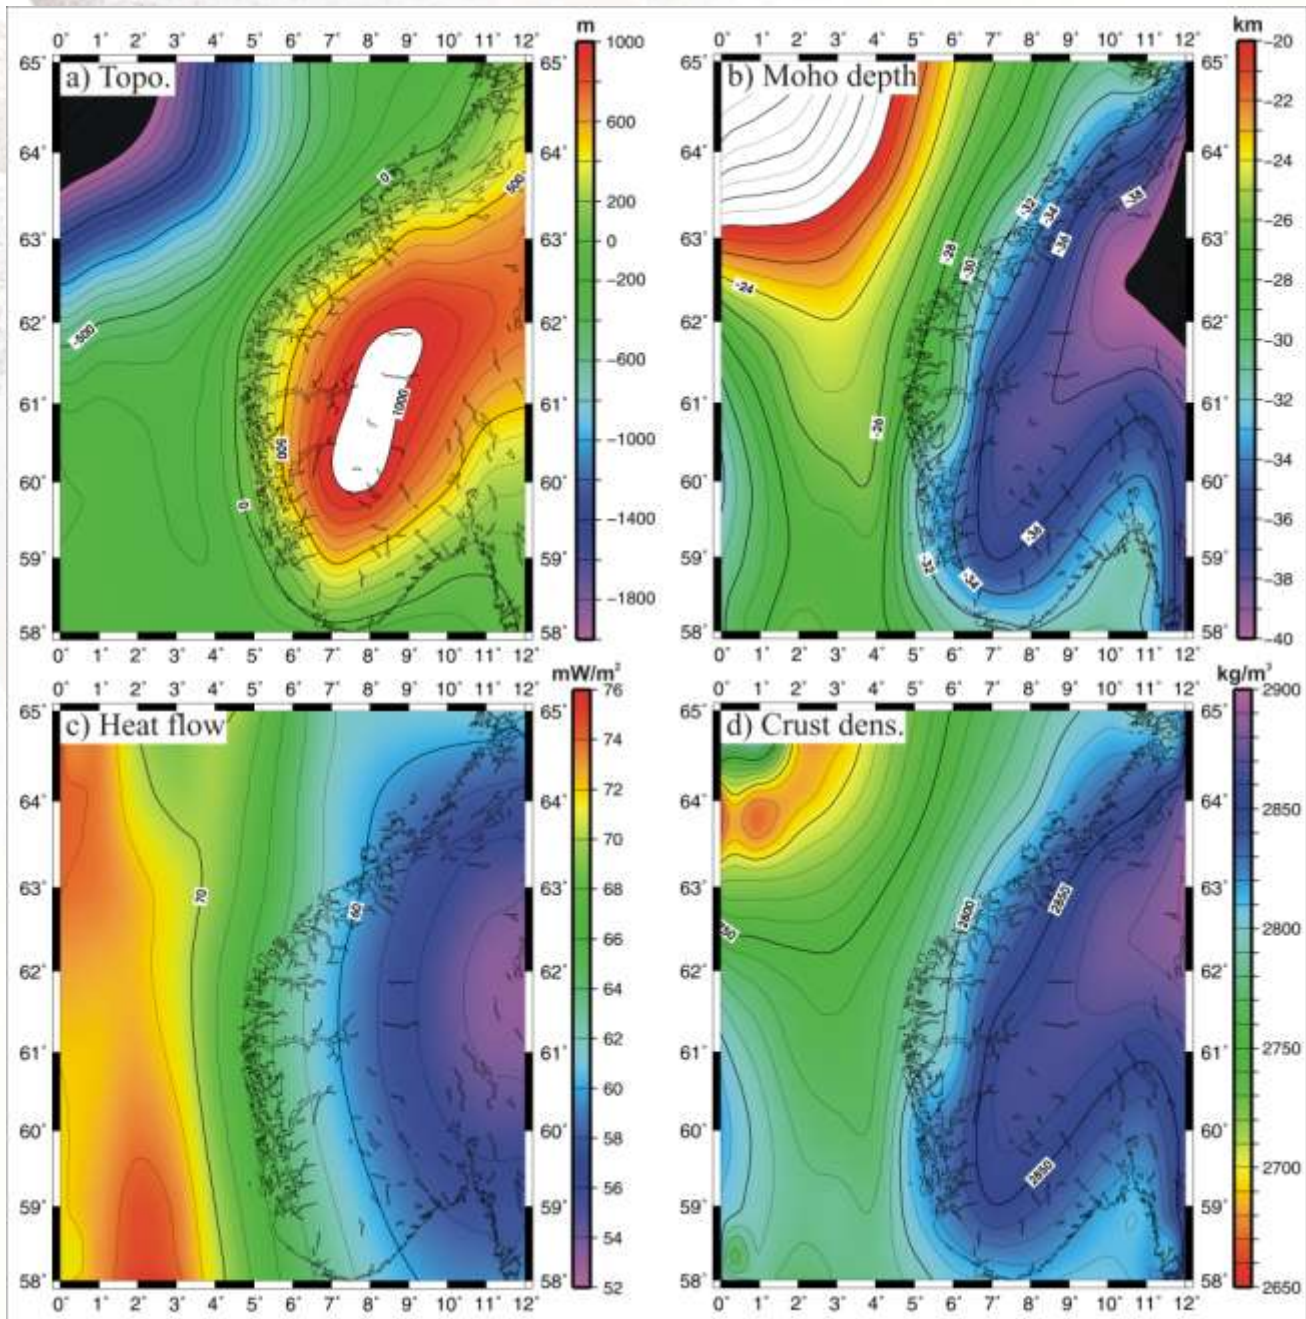

Determined lithosphere thickness (Artemieva 06)

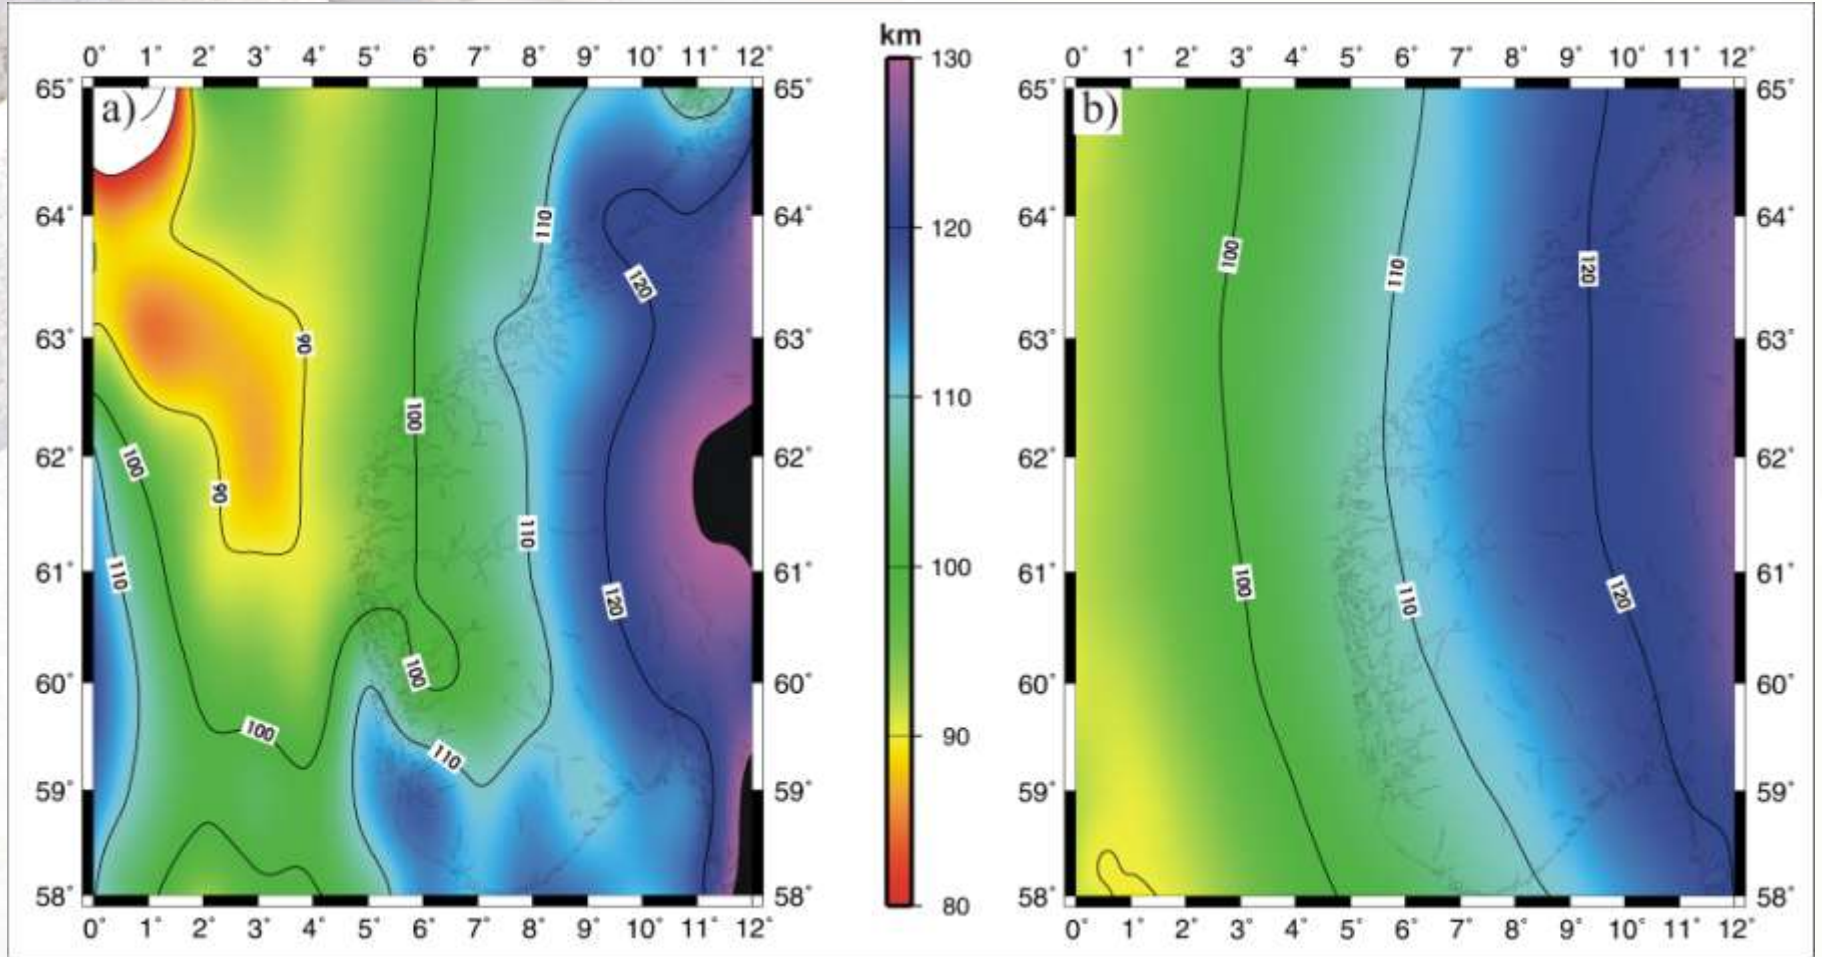

**Thermo-isostatic and stress
modelling of the Southern Scandes**
Pascal and Cloetingh (2009)

Input

RESULTS

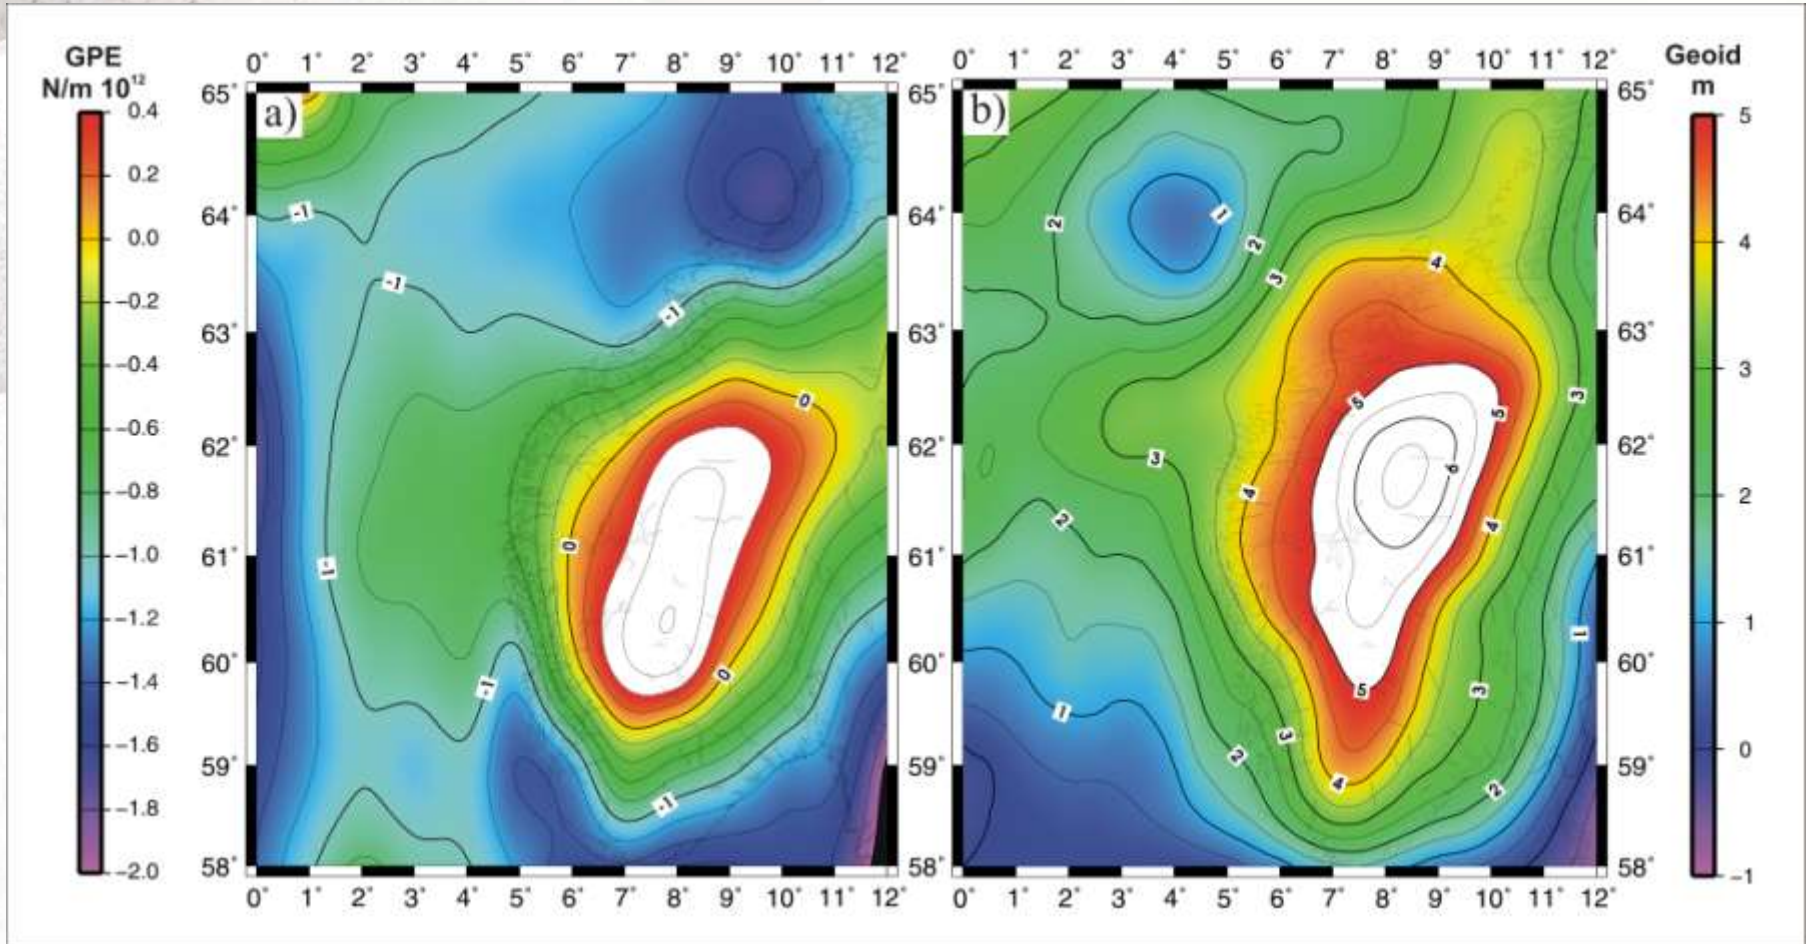

Modelled lithosphere thickness

**Lithosphere thickness from surface waves
(Calcagnile 1982)**

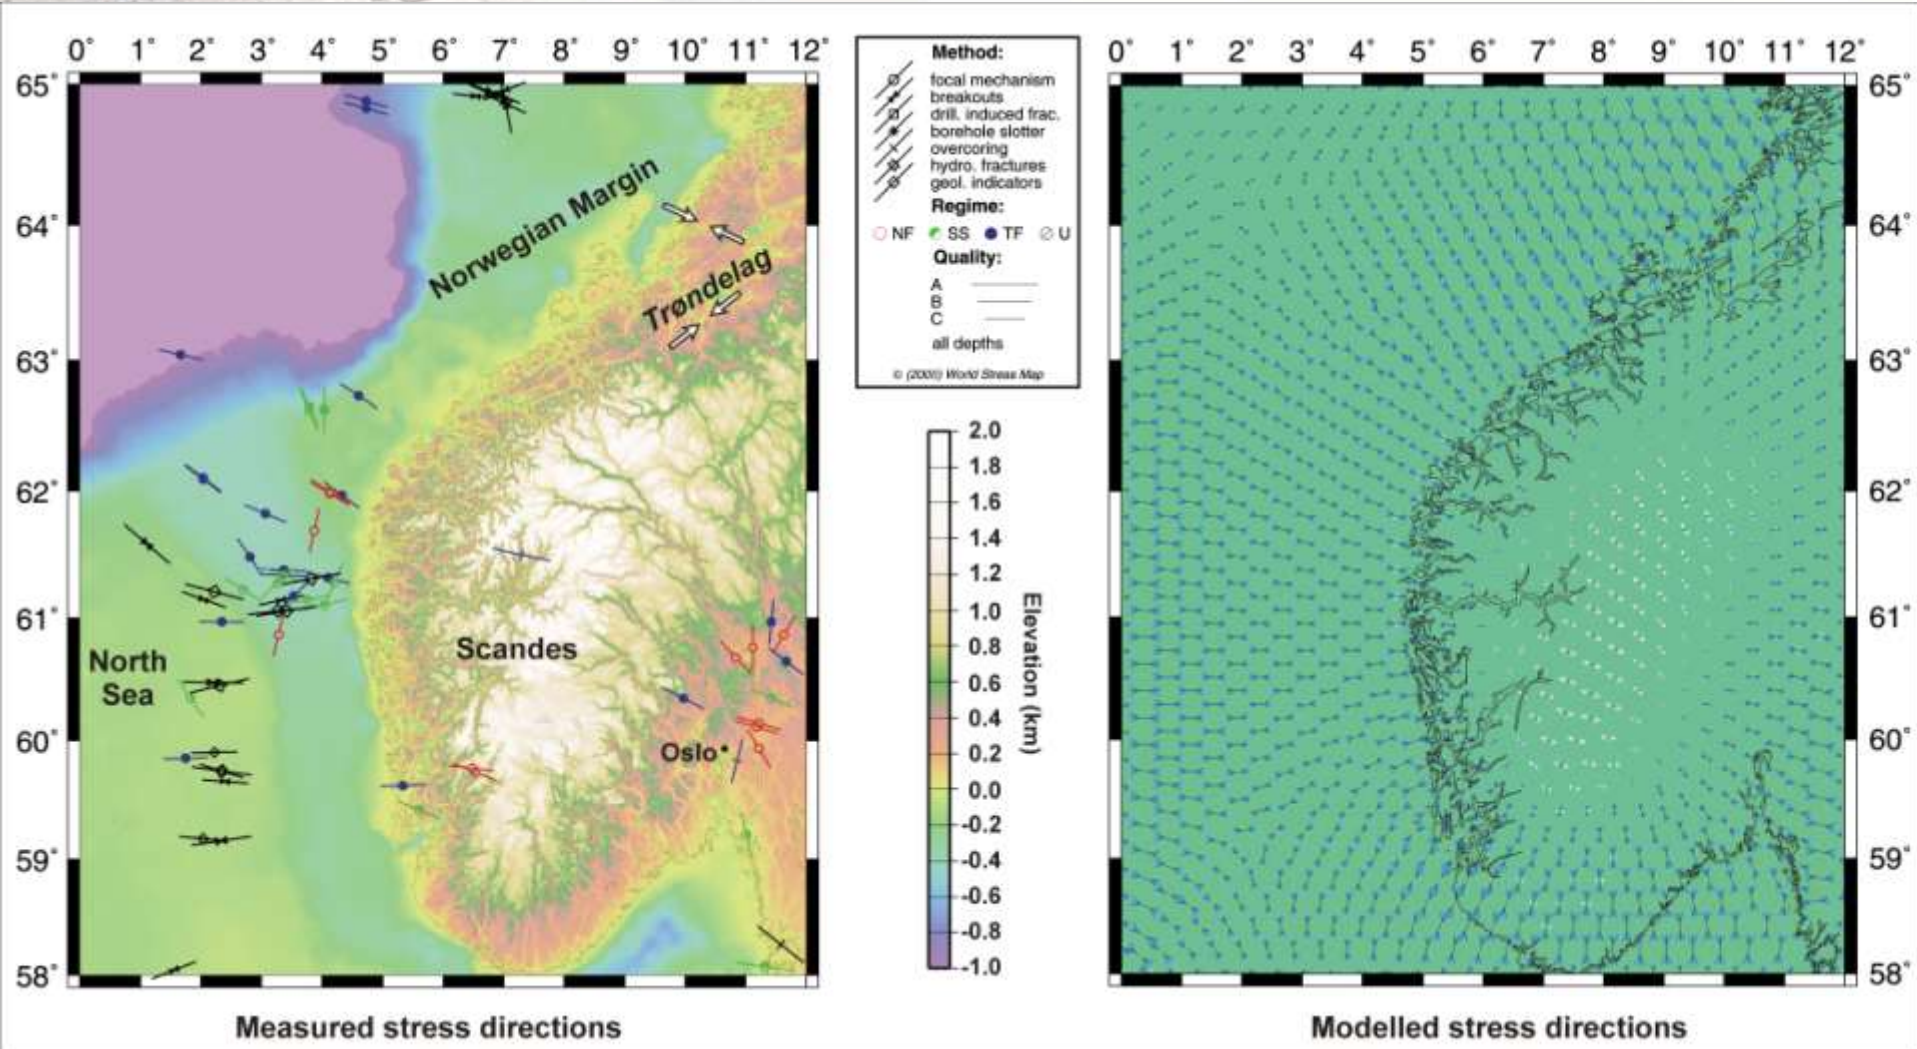

RESULTS

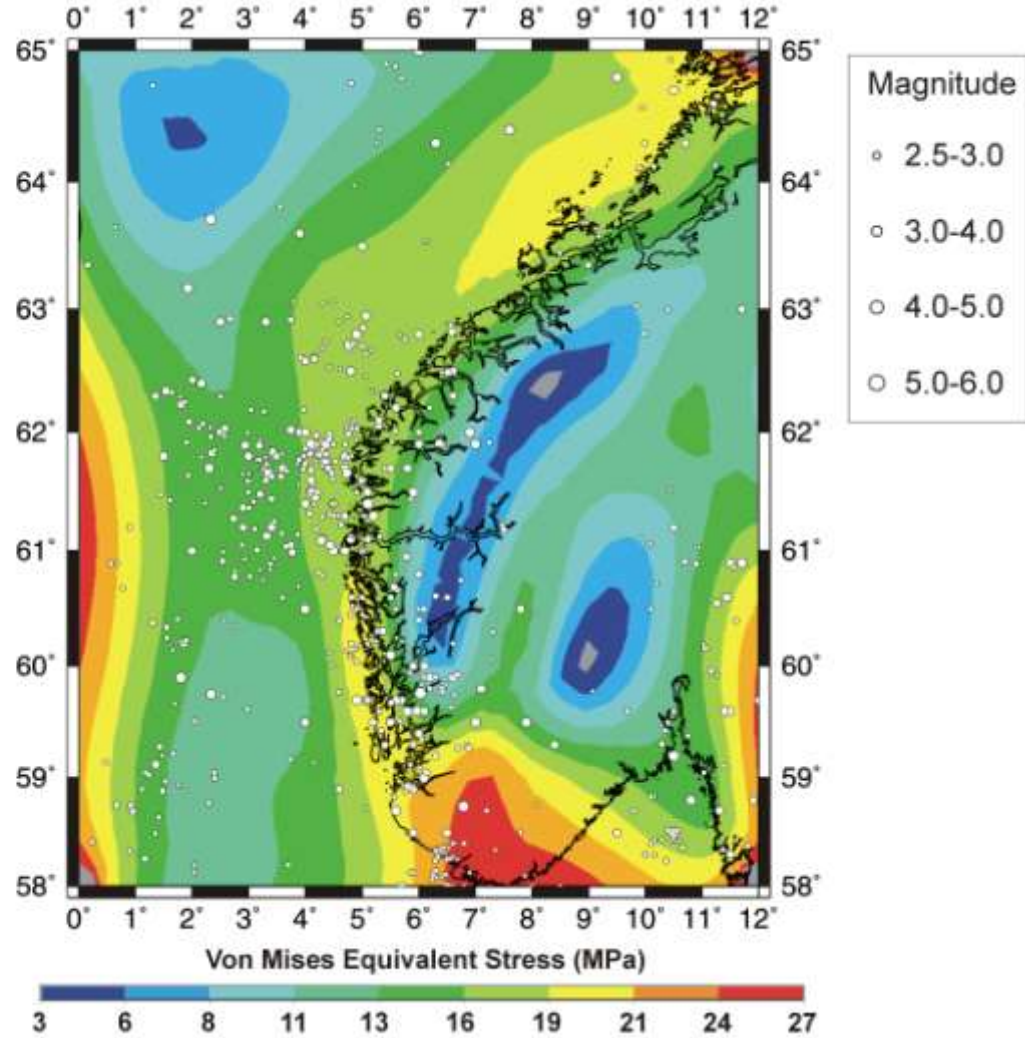

RESULTS

RESULTS

RESULTS

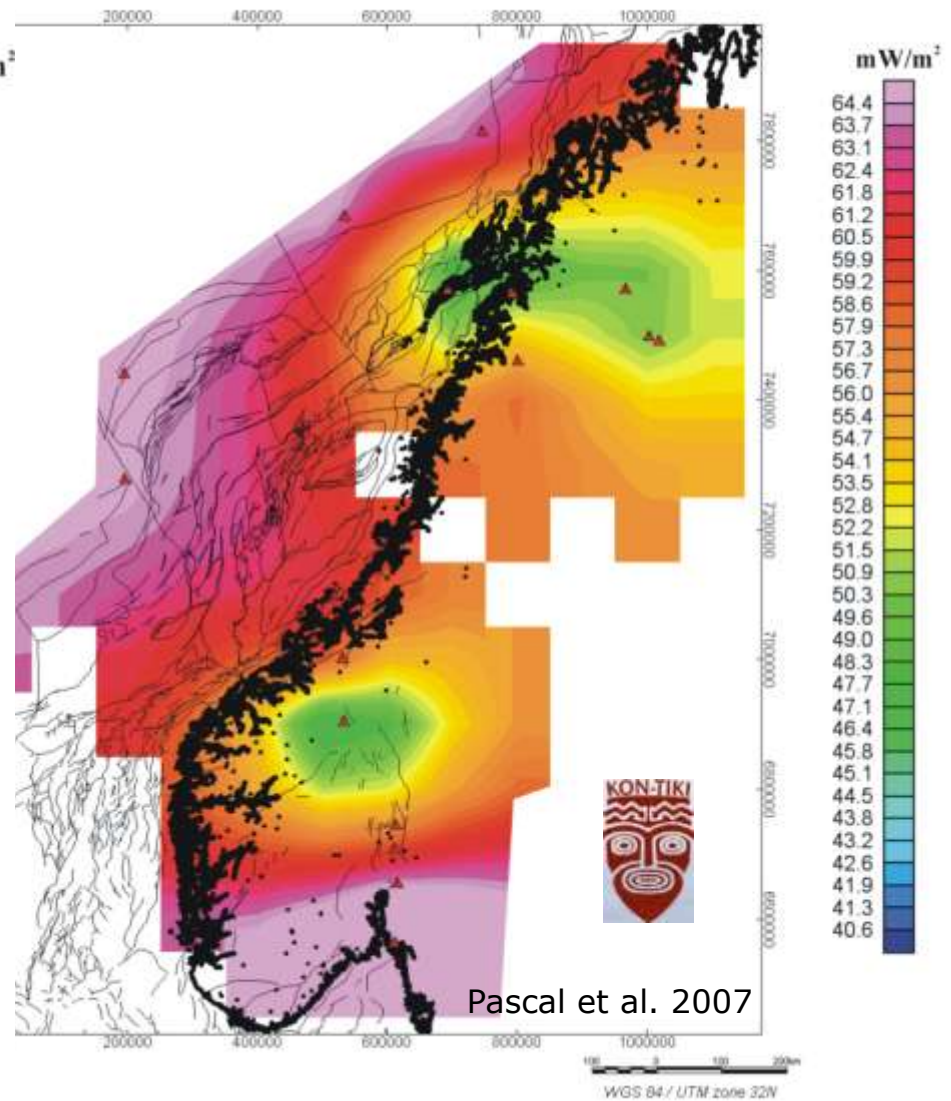

New thermal data in Norway

Heat flow map of Norway

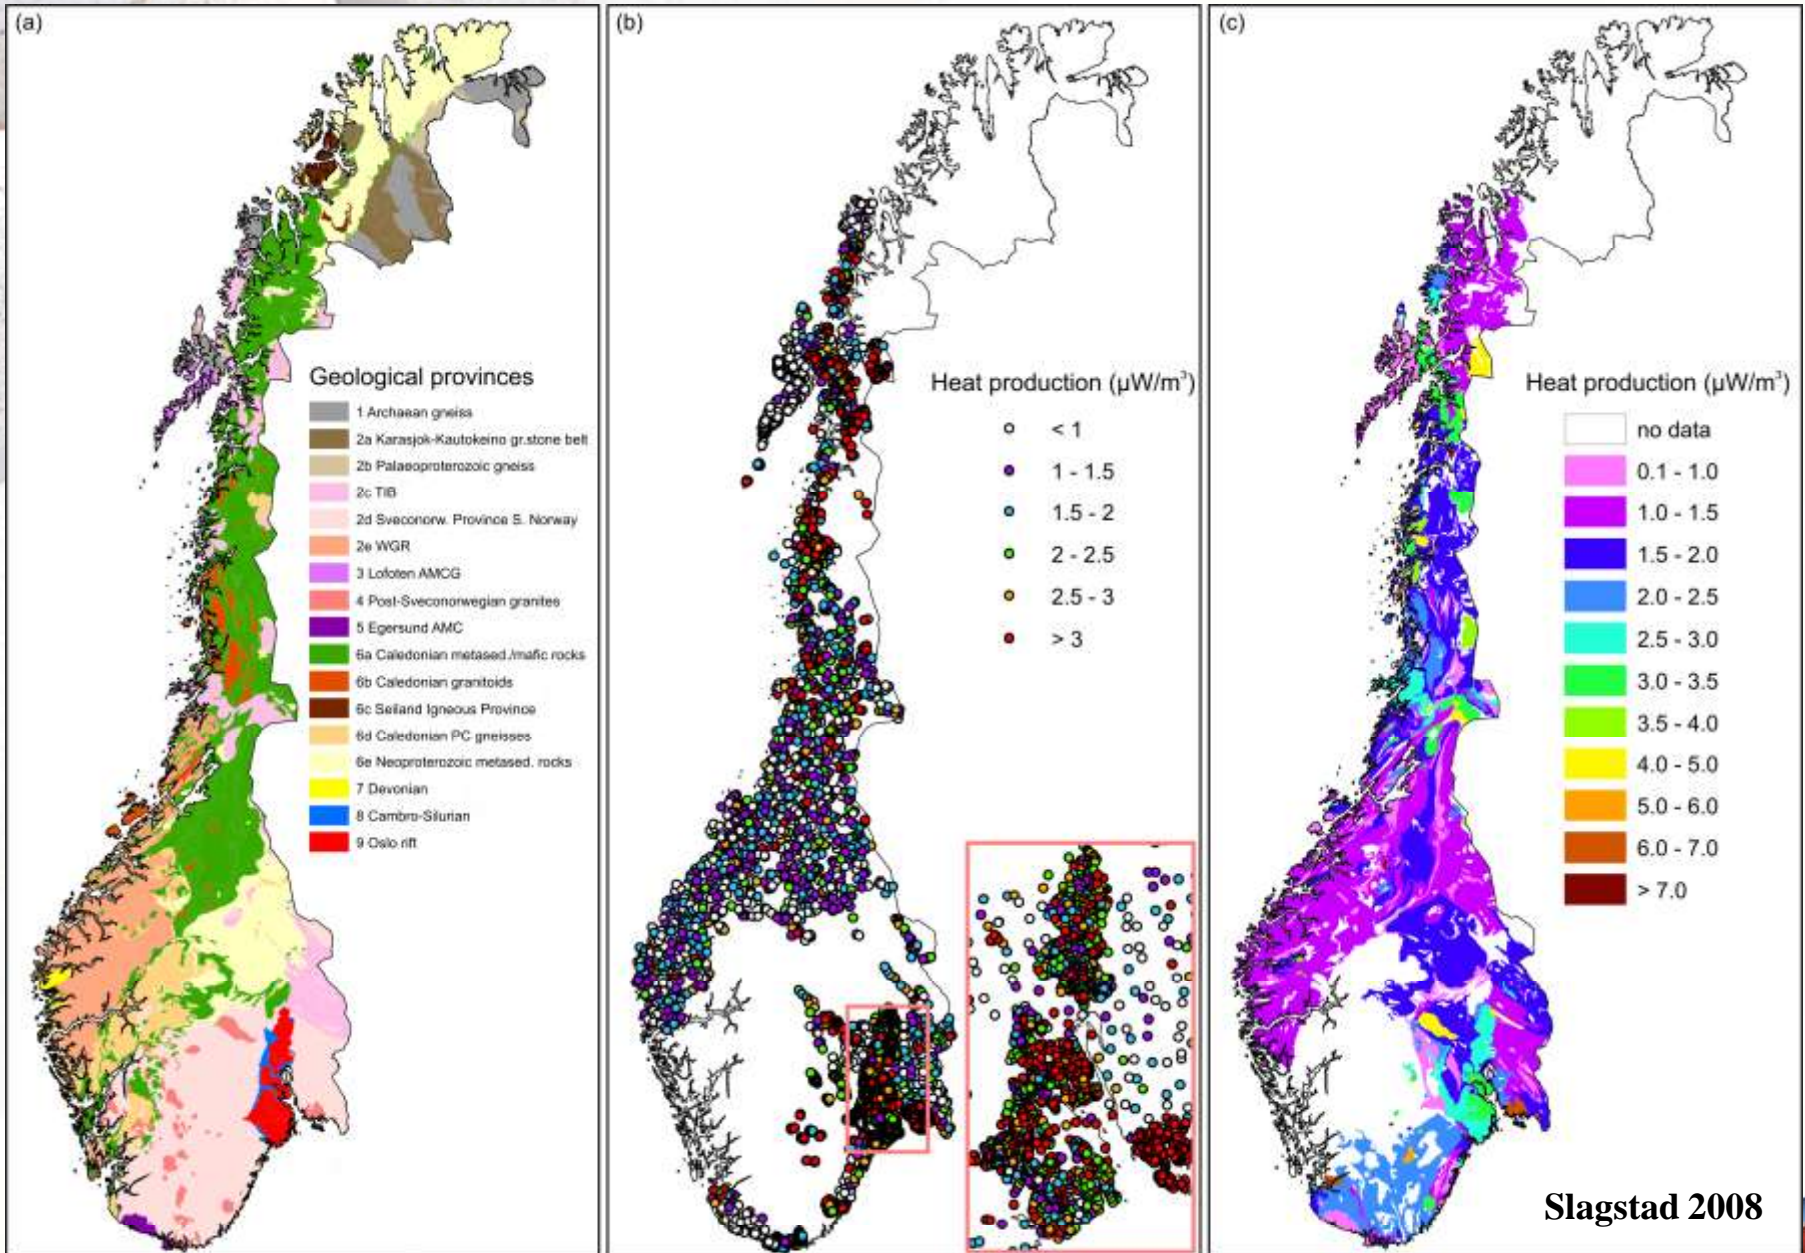

Old data

Kontiki data

Heat generation database (Lito project)

Future work

- Improve modelling techniques (full 3D, regional isostasy).
- Use new constraints from recent heat flow determinations and TopoScandia deep seismic data.
