

Frugal User Involvement

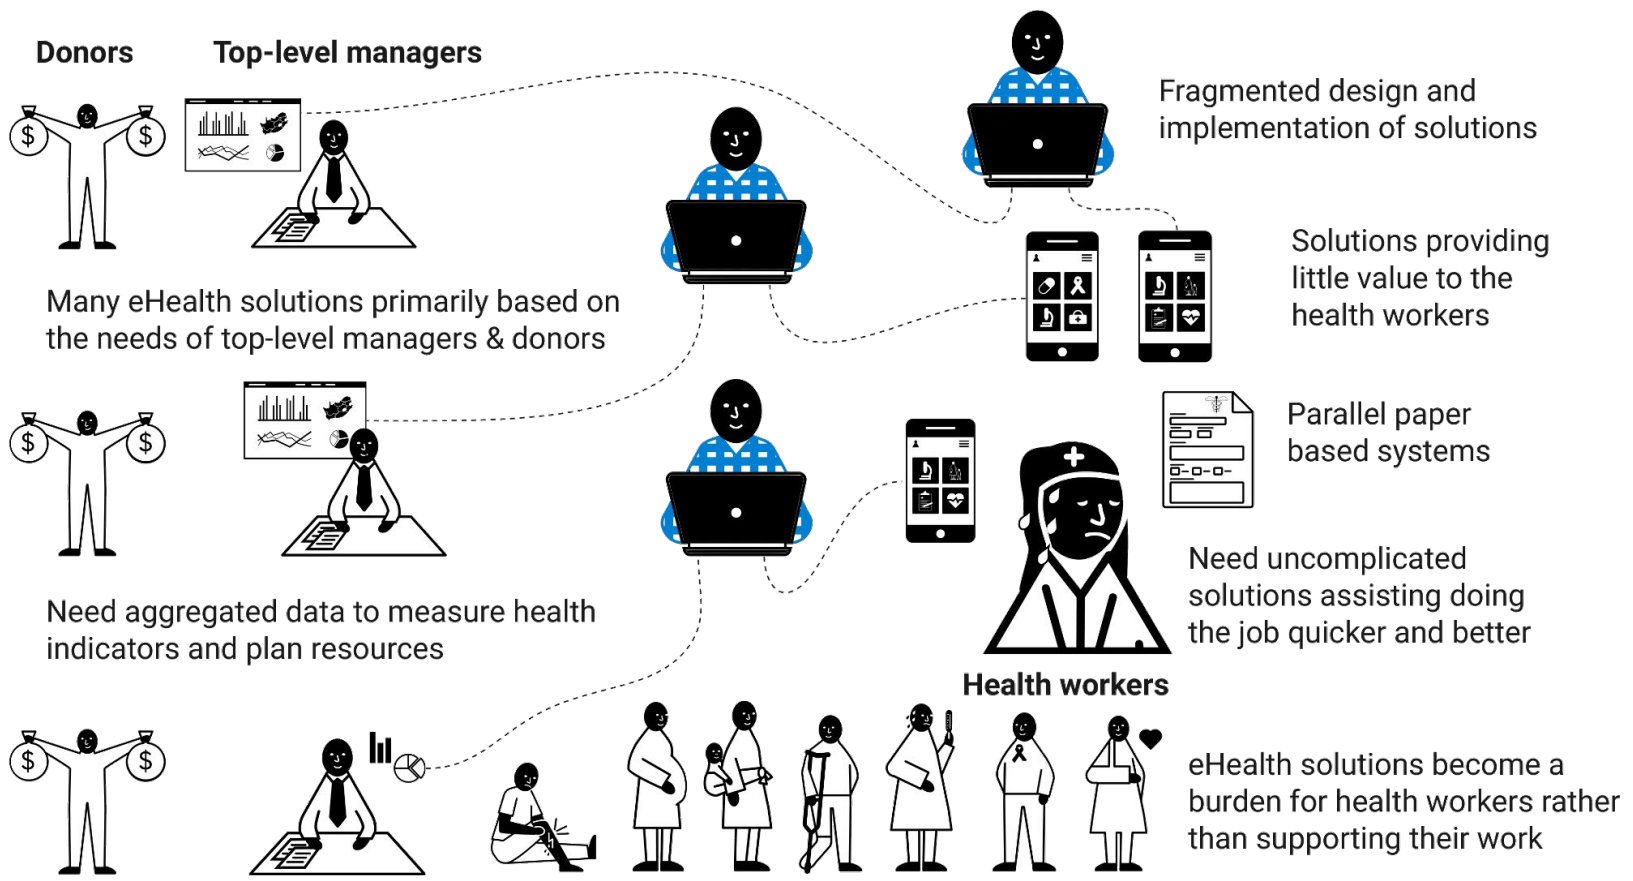

Opportunities for affordable quality user involvement

An idékit of opportunities for better involvement of health workers applied and envisaged by eHealth designer in Africa

Real World Problem

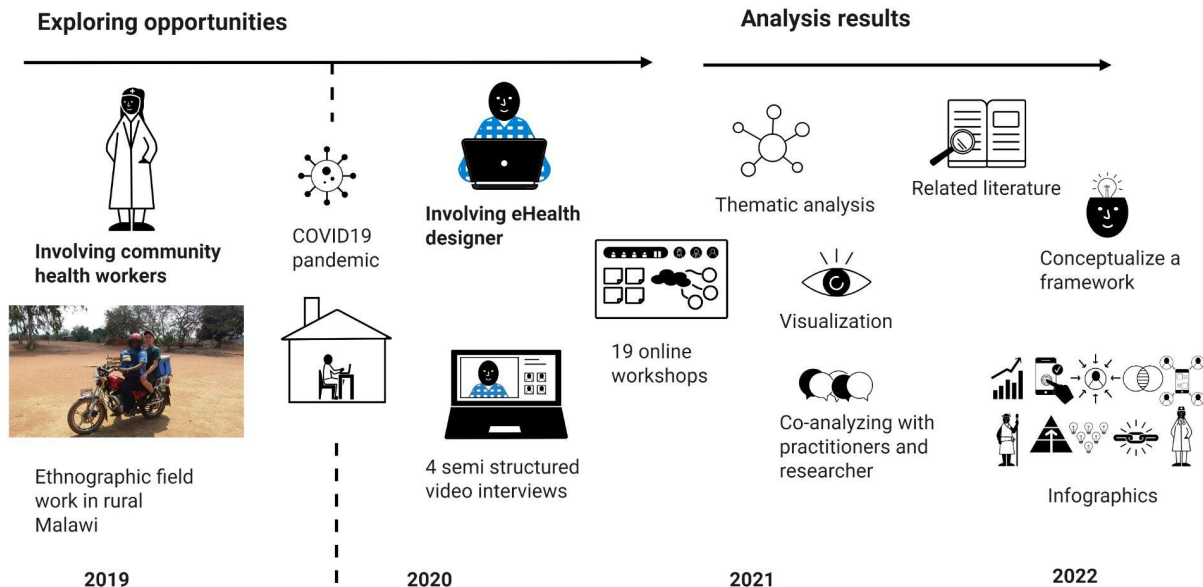

Research question

Which opportunities do eHealth designers in LMICs see for better involvement of healthcare workers during design of eHealth solutions?

Research approach

Engaged Scholarship through exploratory qualitative research

Research process

Principles of user involvement during interaction design

End-users needs

End-users practices

Mutual learning

Co-creation with users

Multiple design iterations

Adapt the means of user involvement to context

Means of user involvement during design

Conventional means

abstract representations

text based

paper based medium

face2face

Challenges identified in LMICs (e.g. Africa):

little exposure to
technology

prefer verbal &
performed communication

Lack of resources to travel
and meet users

Users lack
time

skewed power
relations

Frugal User Involvement

Providing affordable quality user involvement

cost efficiency

attaining quality

appropriate to the context

cost efficient facilitation

enhance product design

illuminate the real-world problem situation

long term cost efficiency for sustainability

empower users

engage user

reduce cost for users

build user capacity

attract resources

engage stakeholders

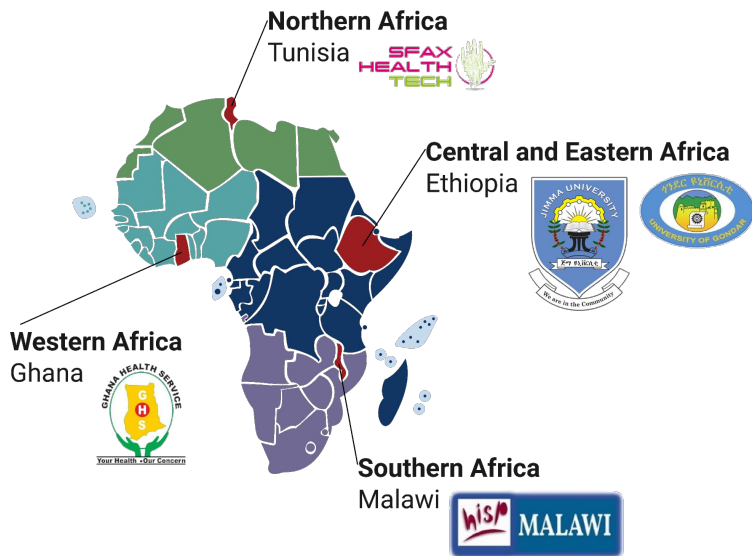

robust

Concepts borrowed from frugal innovation:

Weyrauch, T., Herstatt, C. What is frugal innovation? Three defining criteria. J Frugal Innov 2, 1 (2017). <https://doi.org/10.1186/s40669-016-0005-y>

Research projects aiming to boost international cooperation in eHealth

Four Regional Hubs in Africa lead by African research partners

Research on:

Human, technical & political factors

To inform and strengthen end-user communities and policy makers in making the right decisions

Better health outcomes through better healthcare accessibility and higher quality

In collaboration with European research partners

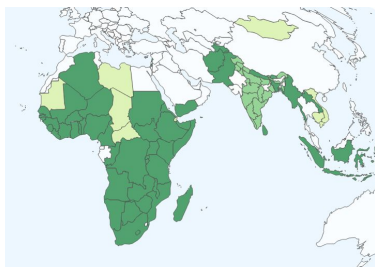

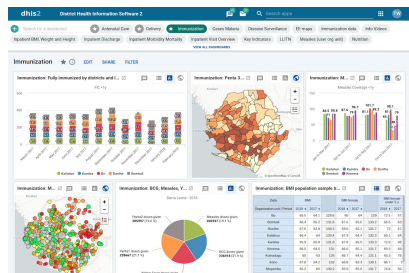

The Health Information Systems Programme

A global action research project coordinated by University of Oslo

Development and implementation of the world's largest health information management system platform used in more than 70 countries

Platform for collecting, analyzing, visualizing and sharing data

www.dhis2.org

Collaboration with HISP nodes throughout Africa

researchers and post-graduate students

research, explore and promote design and innovation within generic enterprise software ecosystems

<https://www.mn.uio.no/hisp/english/dhis2-design-lab/>

Perspective from eHealth designers in Africa

important lessons learned for **frugal user involvement**

experts on current practises and context

Current work practises

Challenges of involving users

Opportunities for better user involvement

Mutual learning between contexts

Participants

37 eHealth designer in Africa

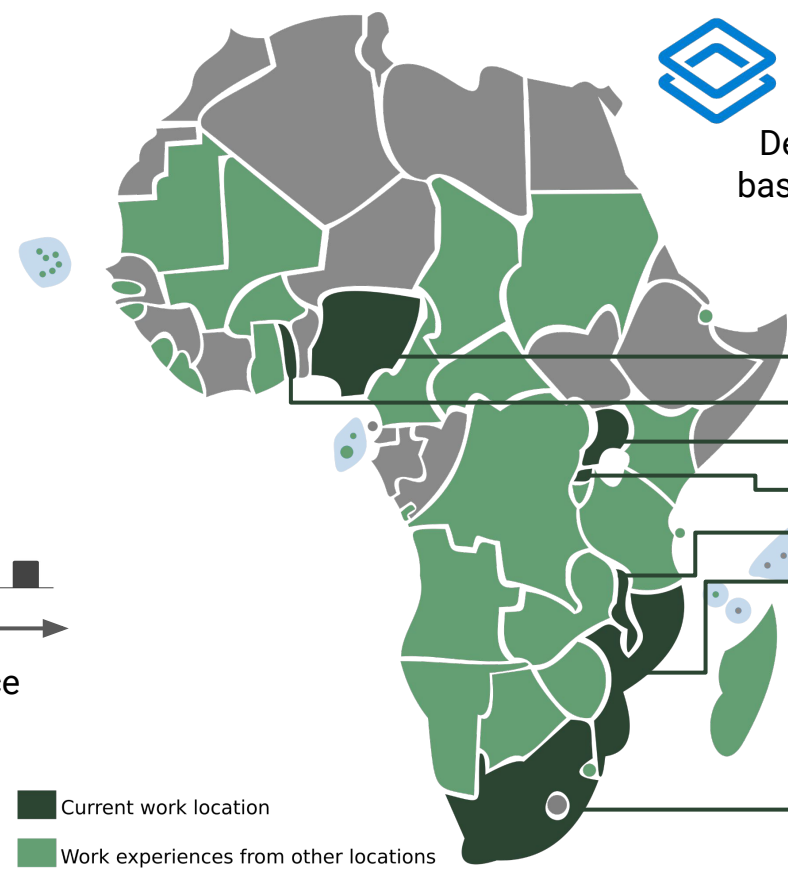

9 women

28 men

1 to 13 years of work experience
6 years in average

dhis2

Development based on DHIS2

Implementing with MOH

- Nigeria (7)
- Togo (3)
- Uganda (4)
- Rwanda (3)
- Malawi (14)
- Mozambique (3)
- South Africa (3)

eHealth design in communities

Facility Healthcare Workers

Doctors Nurses Pharmacists

Laboratory staff Data entry clerks

Community volunteers Expert clients

Community Healthcare Workers

- First-line service in the healthcare sector
- Bridge between the facility & the community

Typical tasks:

- basic preventive healthcare
- health education
- referral and follow up
- assist healthcare recipients to navigate the healthcare system

Healthcare recipients

Community health Stakeholders

Religious leaders Community leaders

Teachers Farmers Fishers

Poverty Traditional medicine Informal drug outlets

Why explore involvement of community healthcare workers in Africa?

Understanding how to better involve users in communities throughout Africa and LMICs

Design4Development - Transformative design

Potential impact

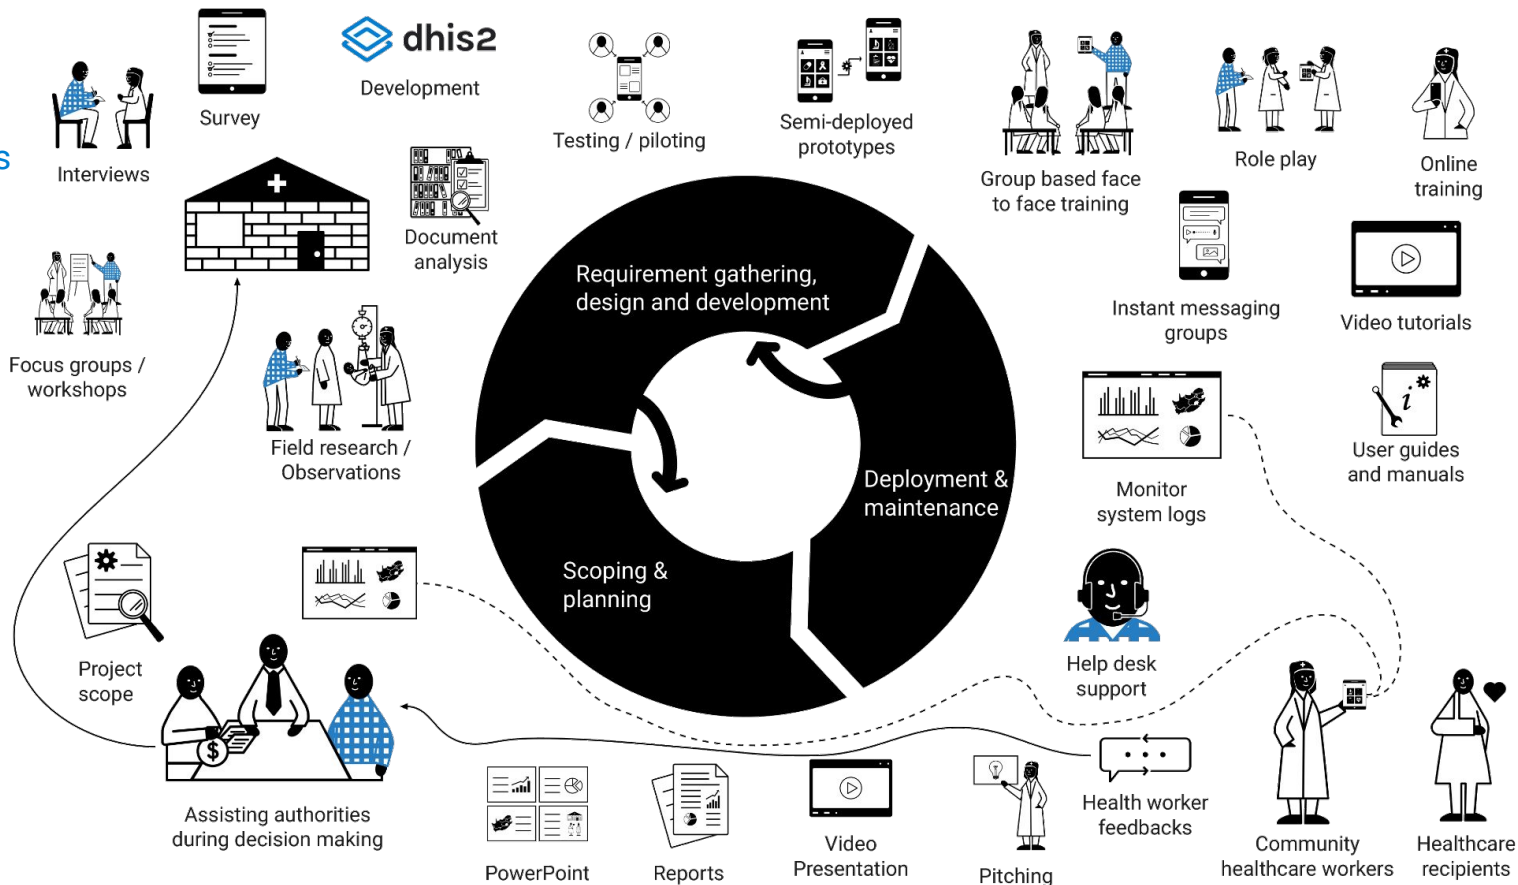

Reverse engineering

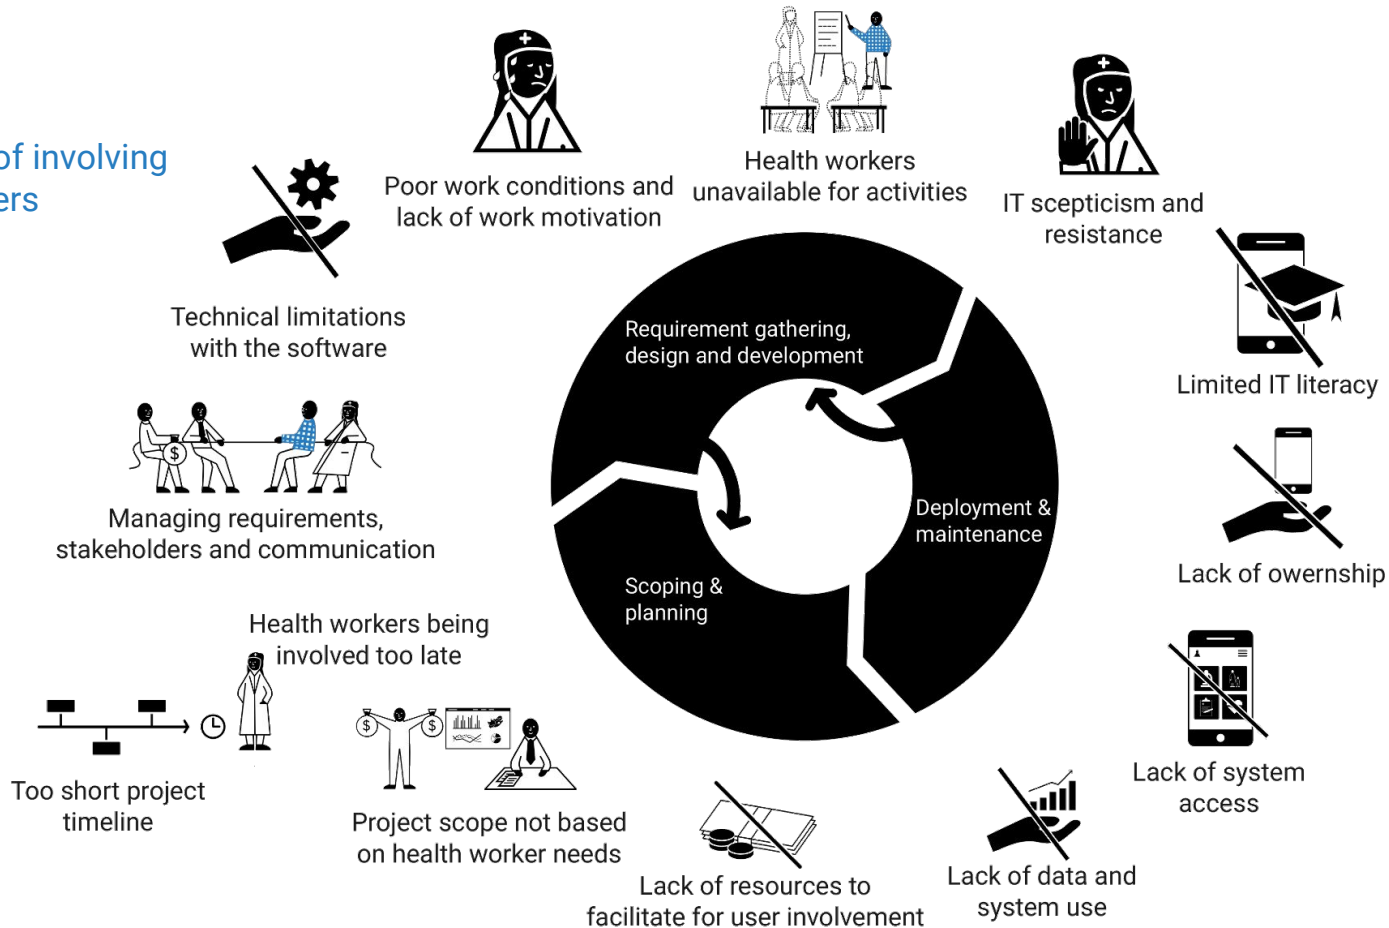

Findings

eHealth designers work practices

Challenges of involving health workers

Opportunity for frugal user involvement

Role play

Instant messaging groups

Visual means

Prototyping with generic software

Peer-driven user involvement

Design Thinking

Improved stakeholder feedback mechanisms

Improved organizing of projects

Opportunity for frugal user involvement

Role play

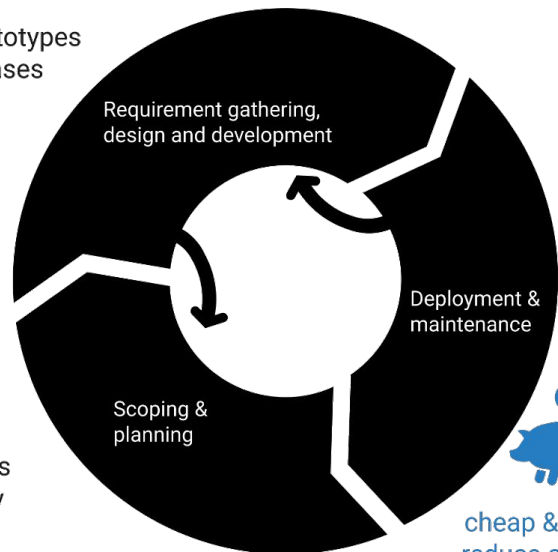

Role play for evaluating prototypes and discover new use cases

Role play for engaging training and eliciting feedbacks

Role play for collecting requirements and exploring ideas in a playful way

cheap & simple, reduce costs for users

let users express needs, understand real use

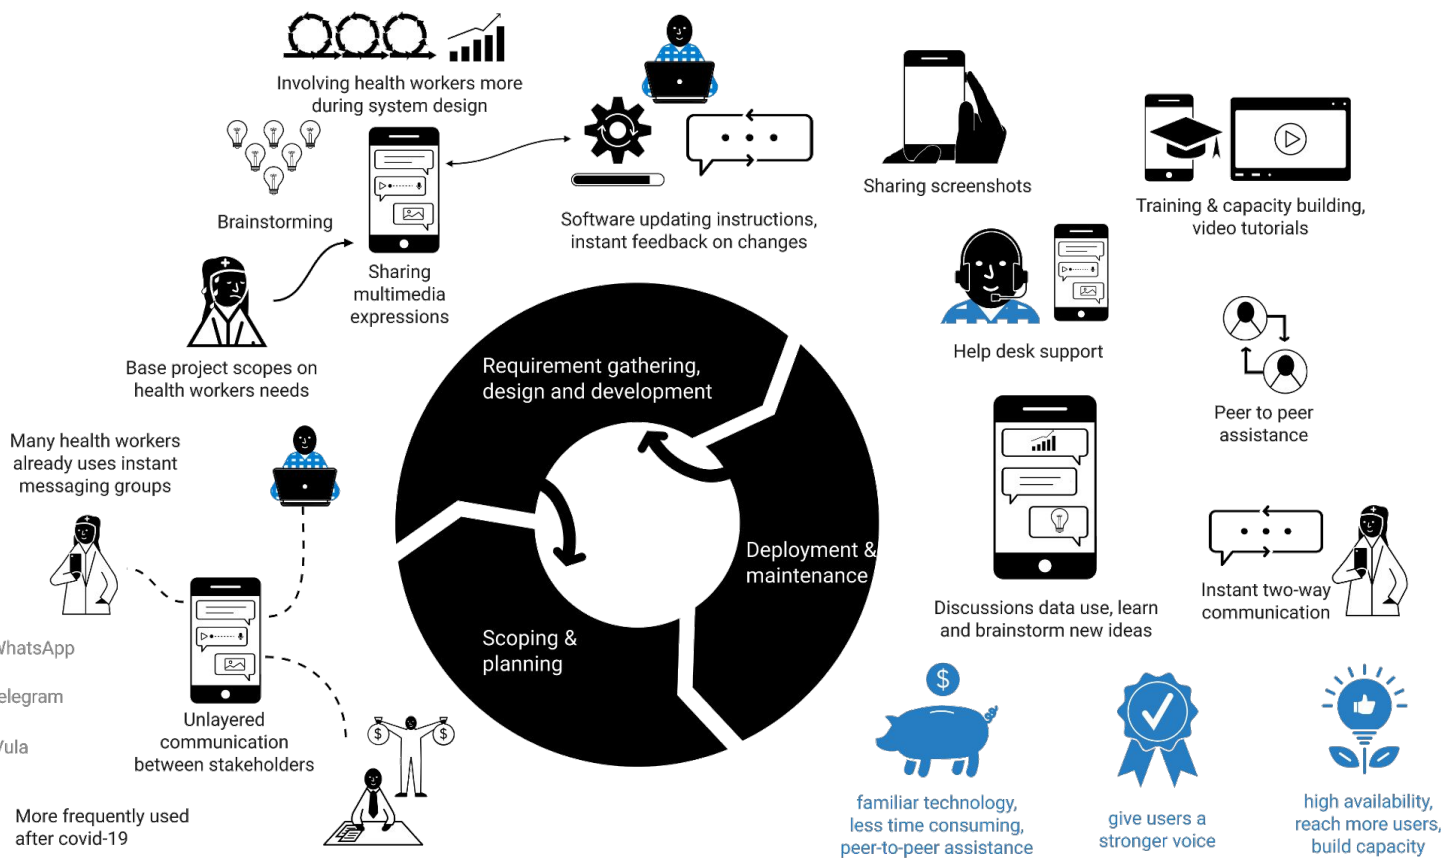

engaging & fun, users natural language

Opportunity for frugal user involvement

Instant messaging groups

- WhatsApp
- Telegram
- Vula
- More frequently used after covid-19

Opportunity for frugal user involvement

Visual means

Multimedia expressions in instant messaging groups

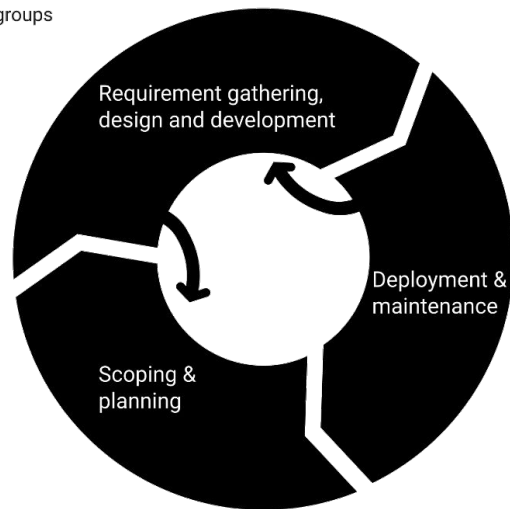

Video tutorial

Illustrated single page manuals

Photos & video to document work context

Illustrated public health messages in local languages

More visual user interfaces

Illustrated posters

More visual reporting to other stakeholders

less efforts for users

more impactful messages

engaging both users and other stakeholders, less ambiguous

Opportunity for frugal user involvement

Design Thinking

Focus on users workflows

More field visits to gain better contextual insights

User journey maps: understand better how the health workers operate during a day or a month

Personas: get a better overview of who the typical health workers are

Brainstorming solutions with health workers

Solve organisational challenges by resolving key issues on the ground

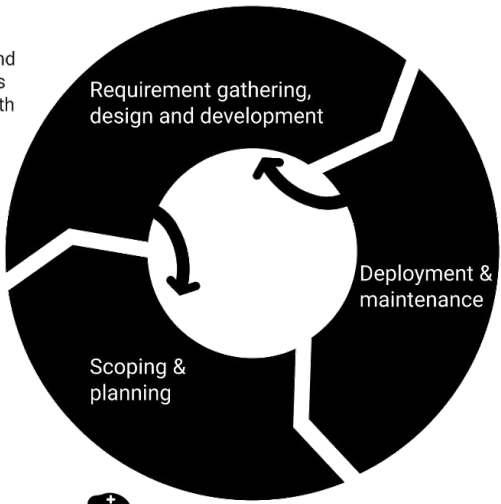

Health workers taking part in deciding which indicators to use and what data to enter

Meet facility leaders and integrate indicators needed locally

Provide more relevant and useful solutions

Postpone discussing technology until after pain points are identified

Base project scopes on health workers needs

discover and resolve design gaps early on

users influence more the product design

engaging users on key issues, create ownership

Opportunity for frugal user involvement

Prototyping with generic software

use more prototypes before implementing the system

early IT training of health workers to get more relevant feedback during the design process

Co-configuration

let users select features they like

Training in semi-deployed systems

quickly adjust deployed system based on feedbacks

functional prototypes at low costs

faster design iterations

capacitate users to participate

Opportunity for frugal user involvement

Health workers learning about each others work practices

committee of end-users to receive and manage feedback

Peer driven training and activities by health workers

Peer learning between facilities

Provide digital career paths

Peer support using instant messaging groups

Peer-driven user involvement

Health workers being better involved in requirement gathering

Healthcare workers represented in development team

Feedback through facility leaders

Health workers assist involving the healthcare recipients

more sustainable impact

capacitate the community level

create ownership of the process

Opportunity for frugal user involvement

Let health workers participate in workshops with other stakeholders

Elicit buy in from key stakeholders

Let health workers evaluate prototypes with other stakeholders

More visual reporting to engage key stakeholders

Improved stakeholder feedback mechanisms

Disseminate understanding of health workers needs

digital health coordinators at district level

Let health workers participate in webinars with other stakeholders

Give the health workers a stronger voice

share use cases with software vendors

More feedback to the health workers

Improve communication and align all the stakeholders

attract resources

give users a stronger voice

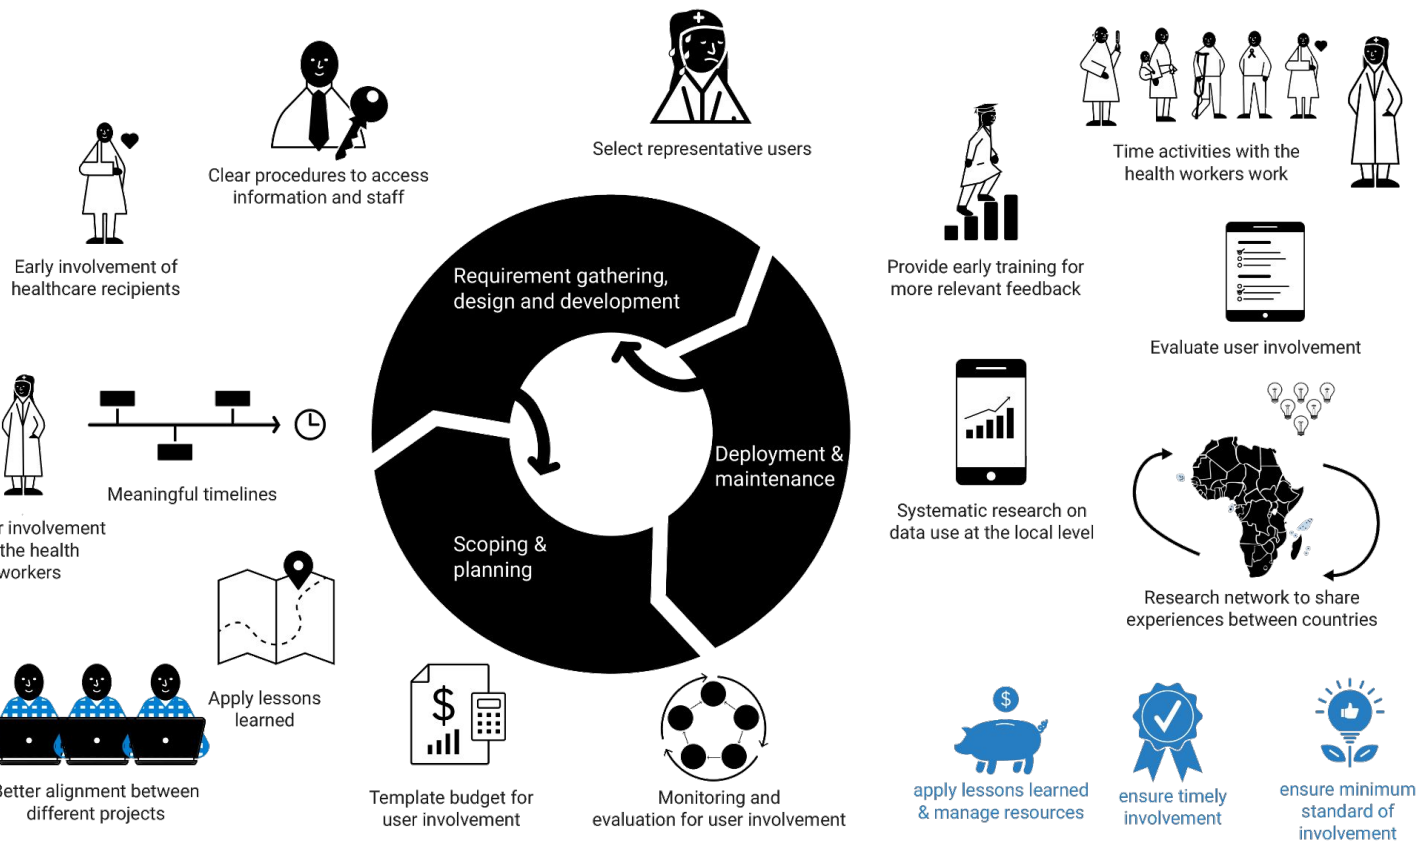

engage key stakeholders

Opportunity for frugal user involvement

Improved organizing of projects

Early involvement of healthcare recipients

Clear procedures to access information and staff

Select representative users

Time activities with the health workers work

Provide early training for more relevant feedback

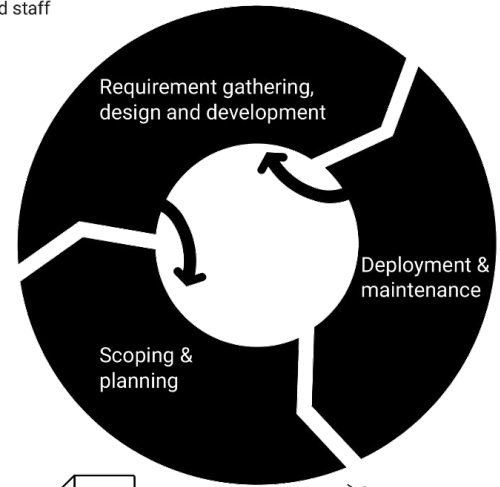

Evaluate user involvement

Earlier involvement of the health workers

Meaningful timelines

Systematic research on data use at the local level

Research network to share experiences between countries

Better alignment between different projects

Apply lessons learned

Template budget for user involvement

Monitoring and evaluation for user involvement

apply lessons learned & manage resources

ensure timely involvement

ensure minimum standard of involvement
