

Targeted approach to identify metabolomic pathways significantly altered in gilt-head bream liver and brain exposed to amitriptyline

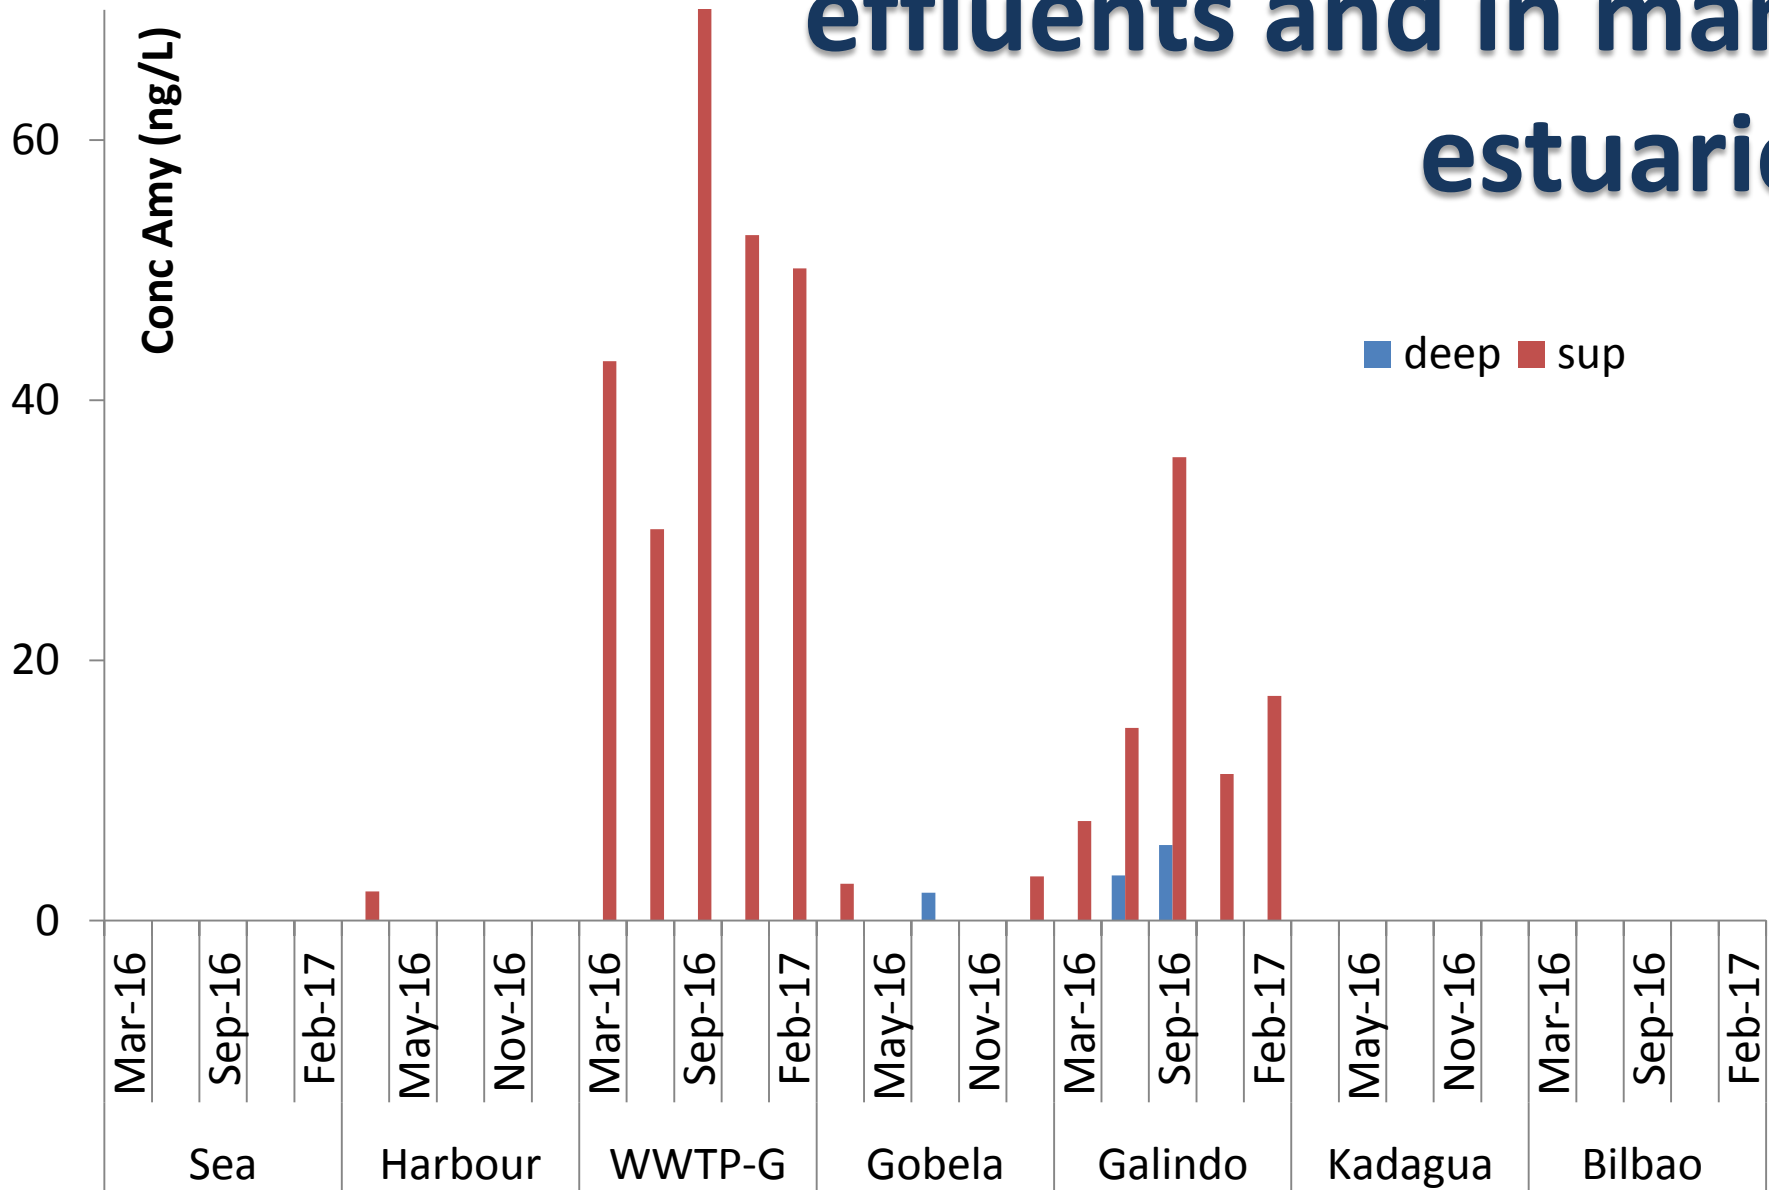

H. Ziarrusta, A. Ribbenstedt, L. Mijangos, A. Prieto, U. Izagirre, M. Olivares, O. Zuloaga, J. P. Benskin, N. Etxebarria

Why Ami?

It is found in WWTP effluents and in many estuaries

We want to know the effects of a chronic exposure under sublethal concentrations

**Gilt-head sea bream
(*Sparus aurata*)**

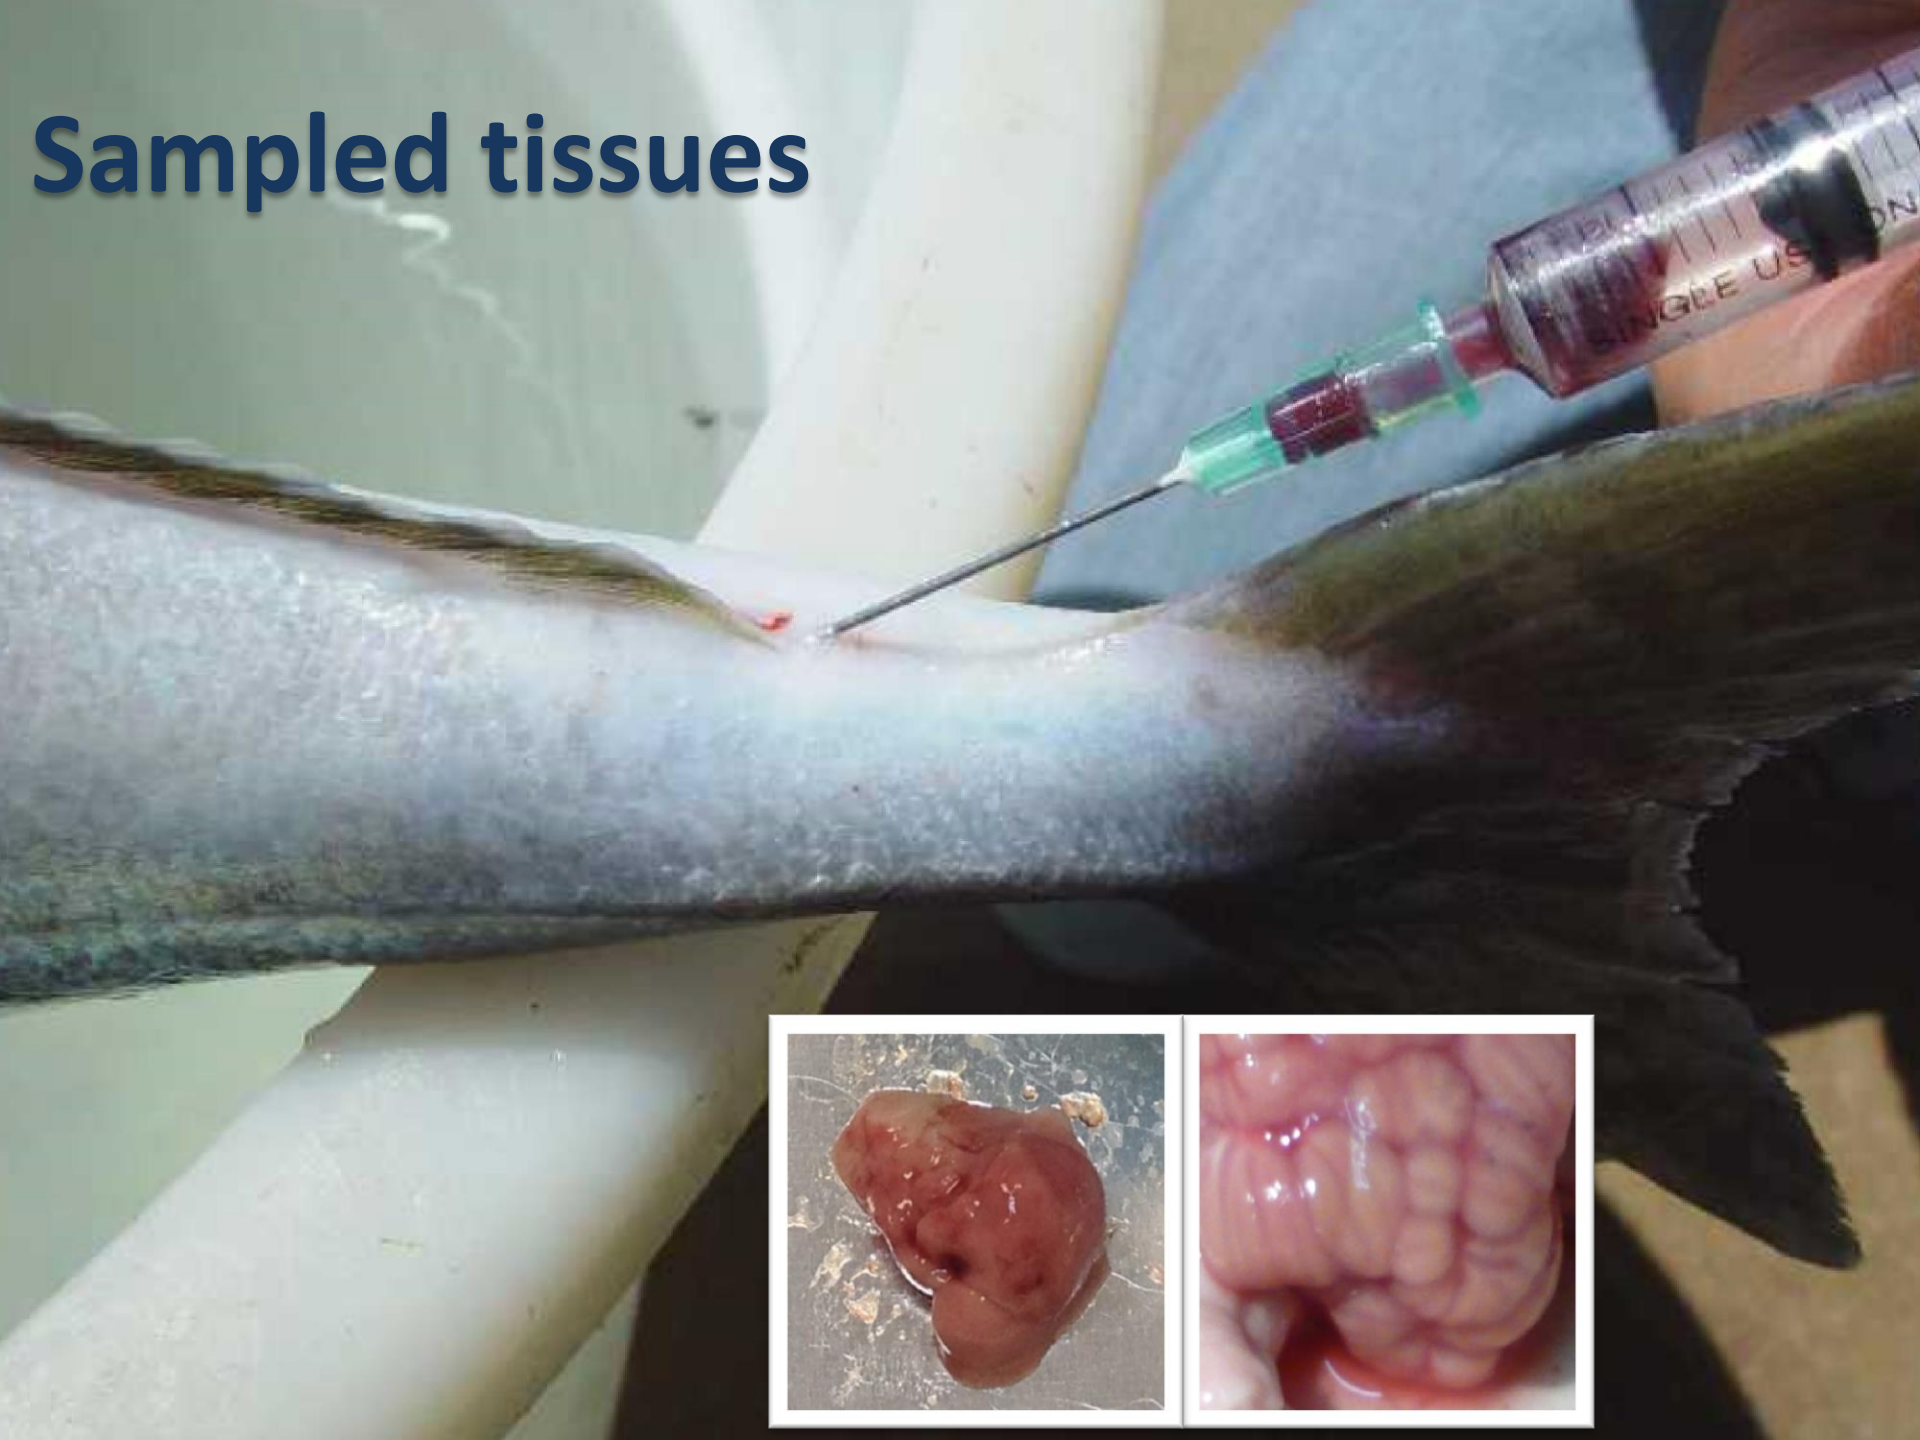

Control tank

Exposed tankç
0.2 ng/ml

Seawater (8.5 L/h)

AMI stock solution (20 mL/h)

Sampled tissues

Analytical Workflow

HILIC UHPLC-MS/MS (38 metabolites)

- Amino acids
- Biogenic amines
- Nucleobases
- Neurotransmitters

Flow Injection-MS/MS (150 polar lipids)

- Carnitines
- Phosphatidylcholines (PCs)
- LysoPCs
- Sphingomyelins

Liver-Exposed+Control

Color Legend

- Control (red circle)
- Exposed (blue circle)

Shape Legend

- Group 0 (circle)
- Group 2 (square)
- Group 4 (triangle)
- Group 7 (star)

Liver-Exposed+Control

Tyrosine

Exposure time is the most significant variable

Control

Exposed

Brain-Exposed+Control

Phenylalanine

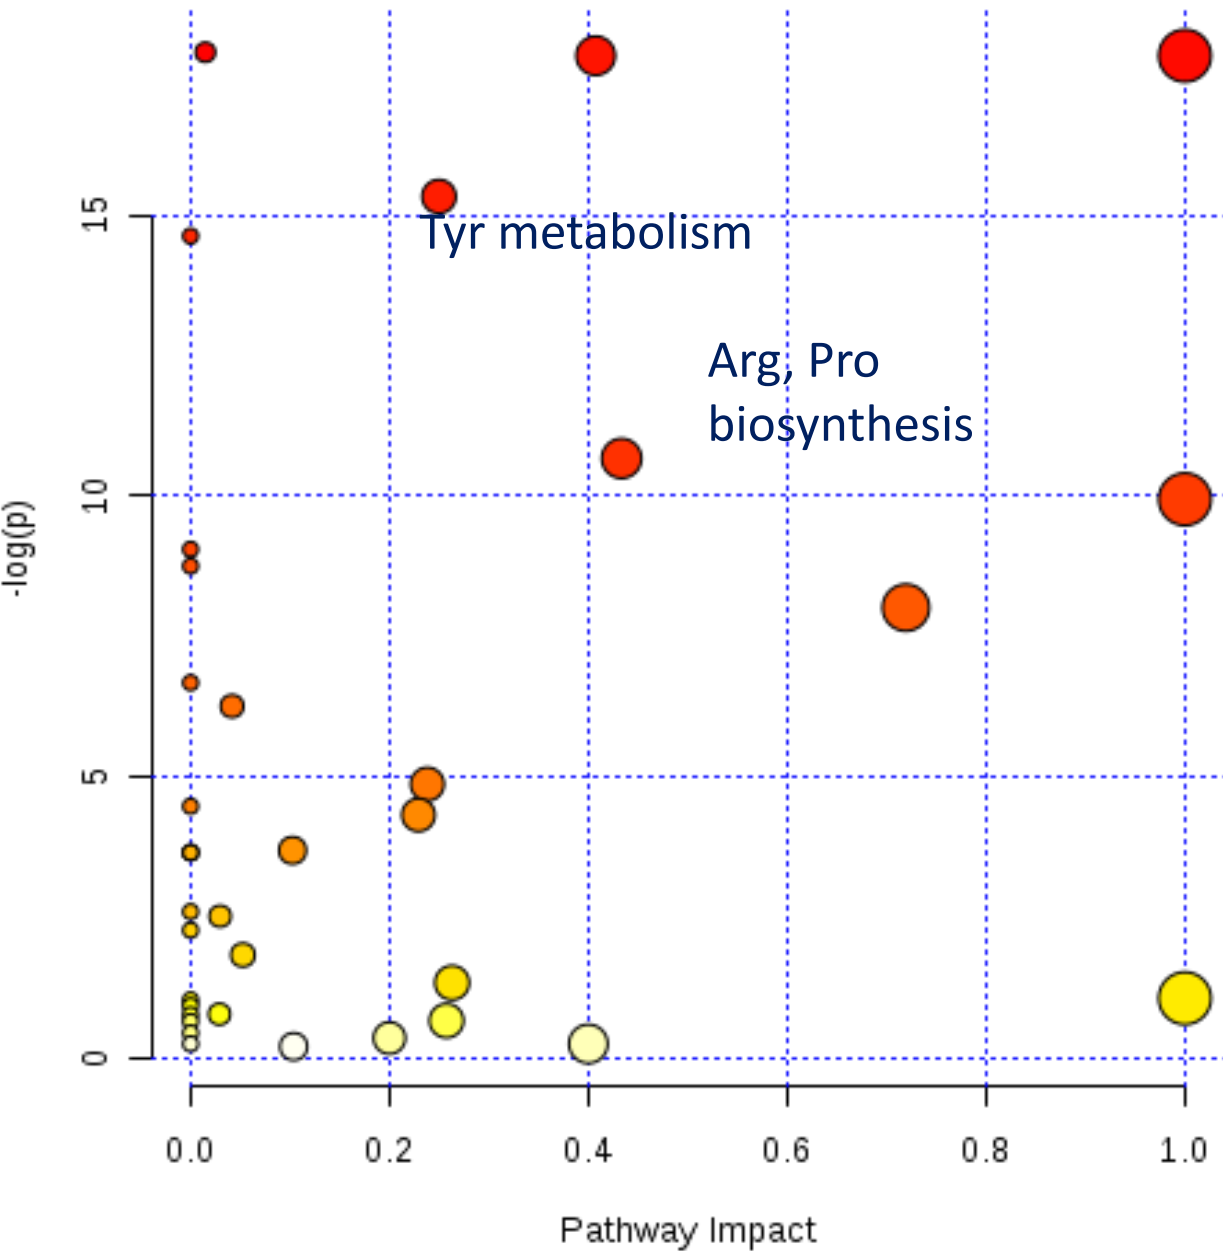

The variations at the brain are less even weaker

Liver metabolism

Brain metabolism

Main conclusions

Good experimental design

Exposure time is more stressing than AMI

New experiments at higher concentration / exposure time

Thank You!
