# CHARACTERIZATION OF CLOUD WATER DISSOLVED ORGANIC MATTER USING FT-ICR-MS.

Angelica Bianco<sup>1</sup>; Edith Nichol<sup>2</sup>; Mickaël Vaïtilingom<sup>1,3</sup>,  
Laurent Deguillaume<sup>1</sup>, Nadine Chaumerliac<sup>1</sup>, Maxime Bridoux<sup>4</sup>

<sup>1</sup> Laboratoire de Météorologie Physique (LaMP), Université Clermont Auvergne, France

<sup>2</sup> Laboratoire de Chimie Moléculaire, Ecole Polytechnique, Université Paris Saclay

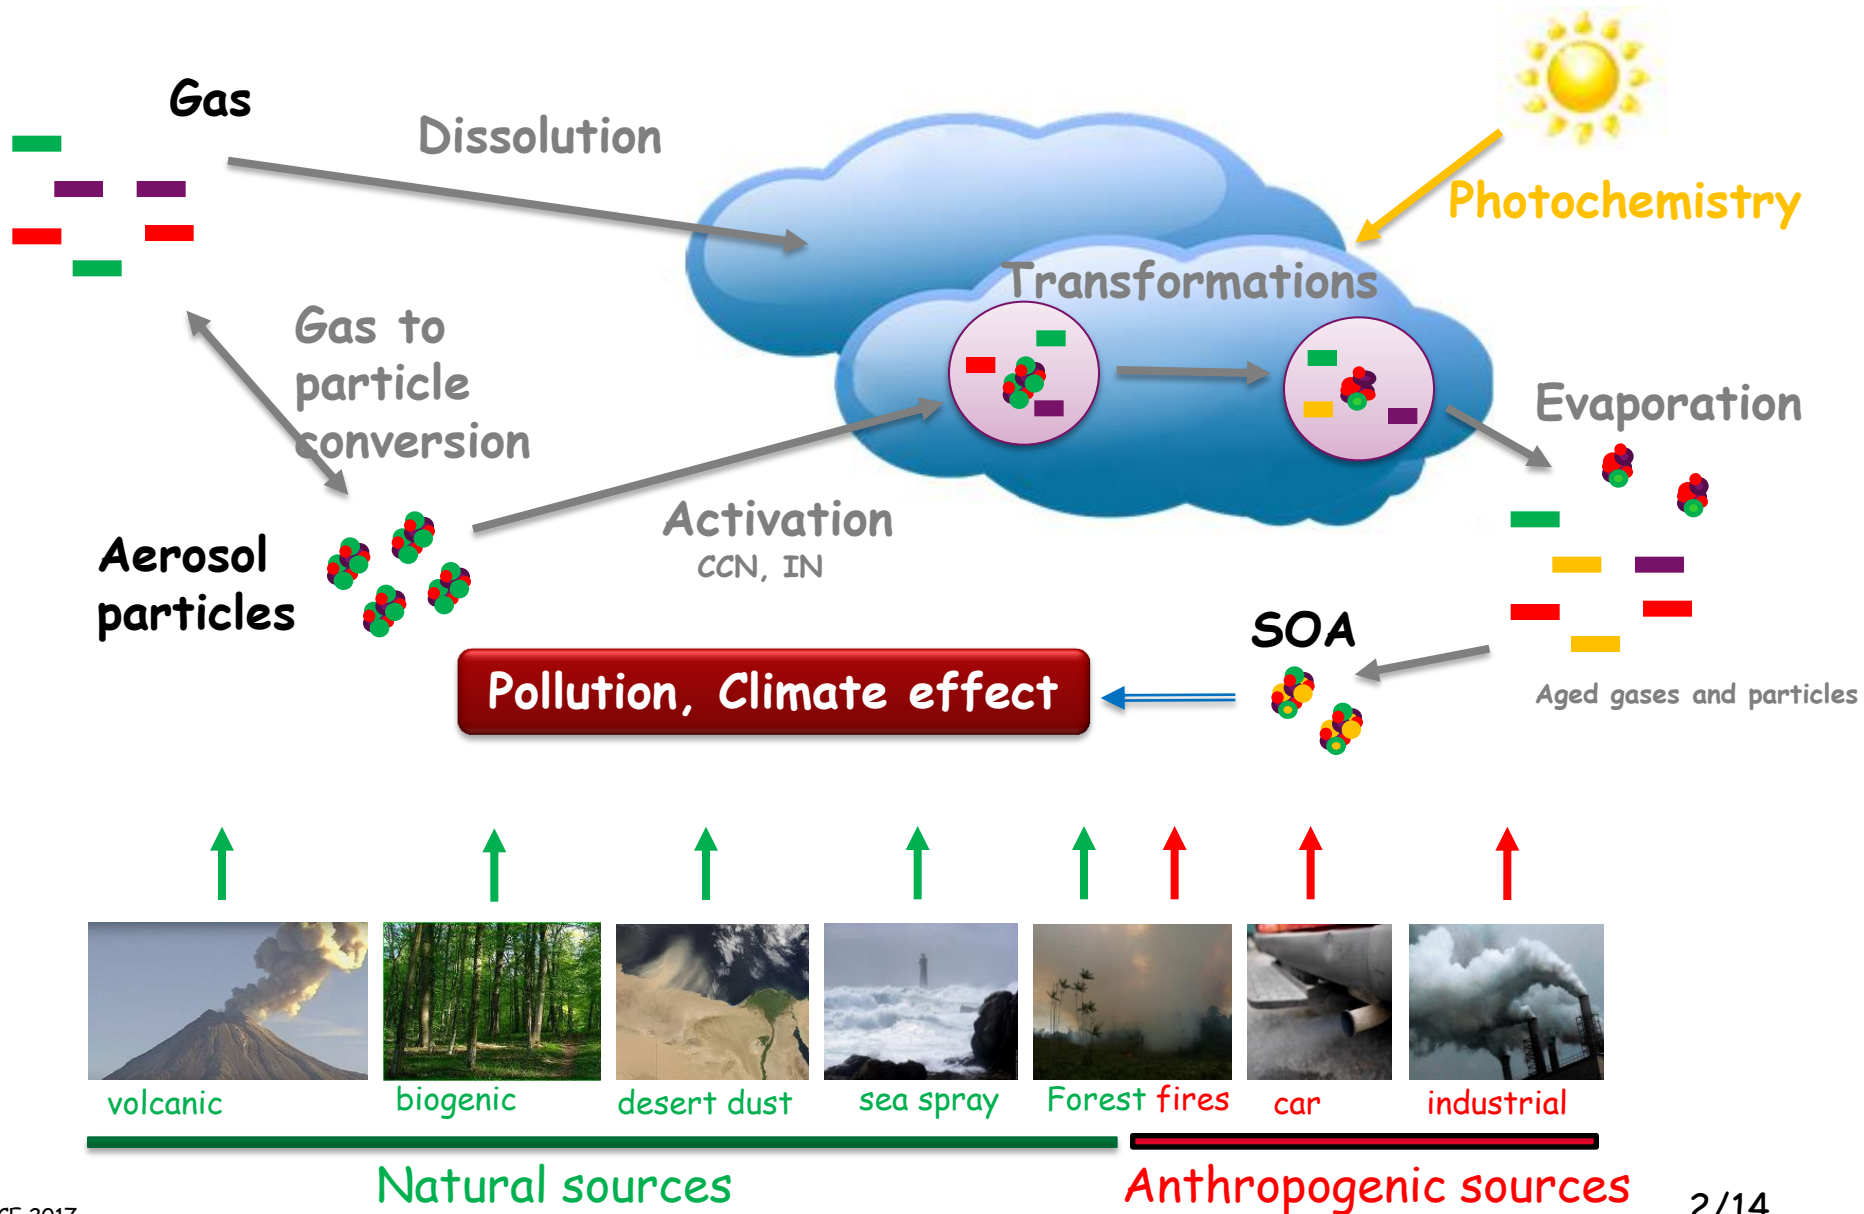

<sup>3</sup> now at Université des Antilles, Department of Physics, 97110 Pointe-à-Pitre, France

<sup>4</sup> CEA, DAM, DIF, F-91297 Arpajon, France

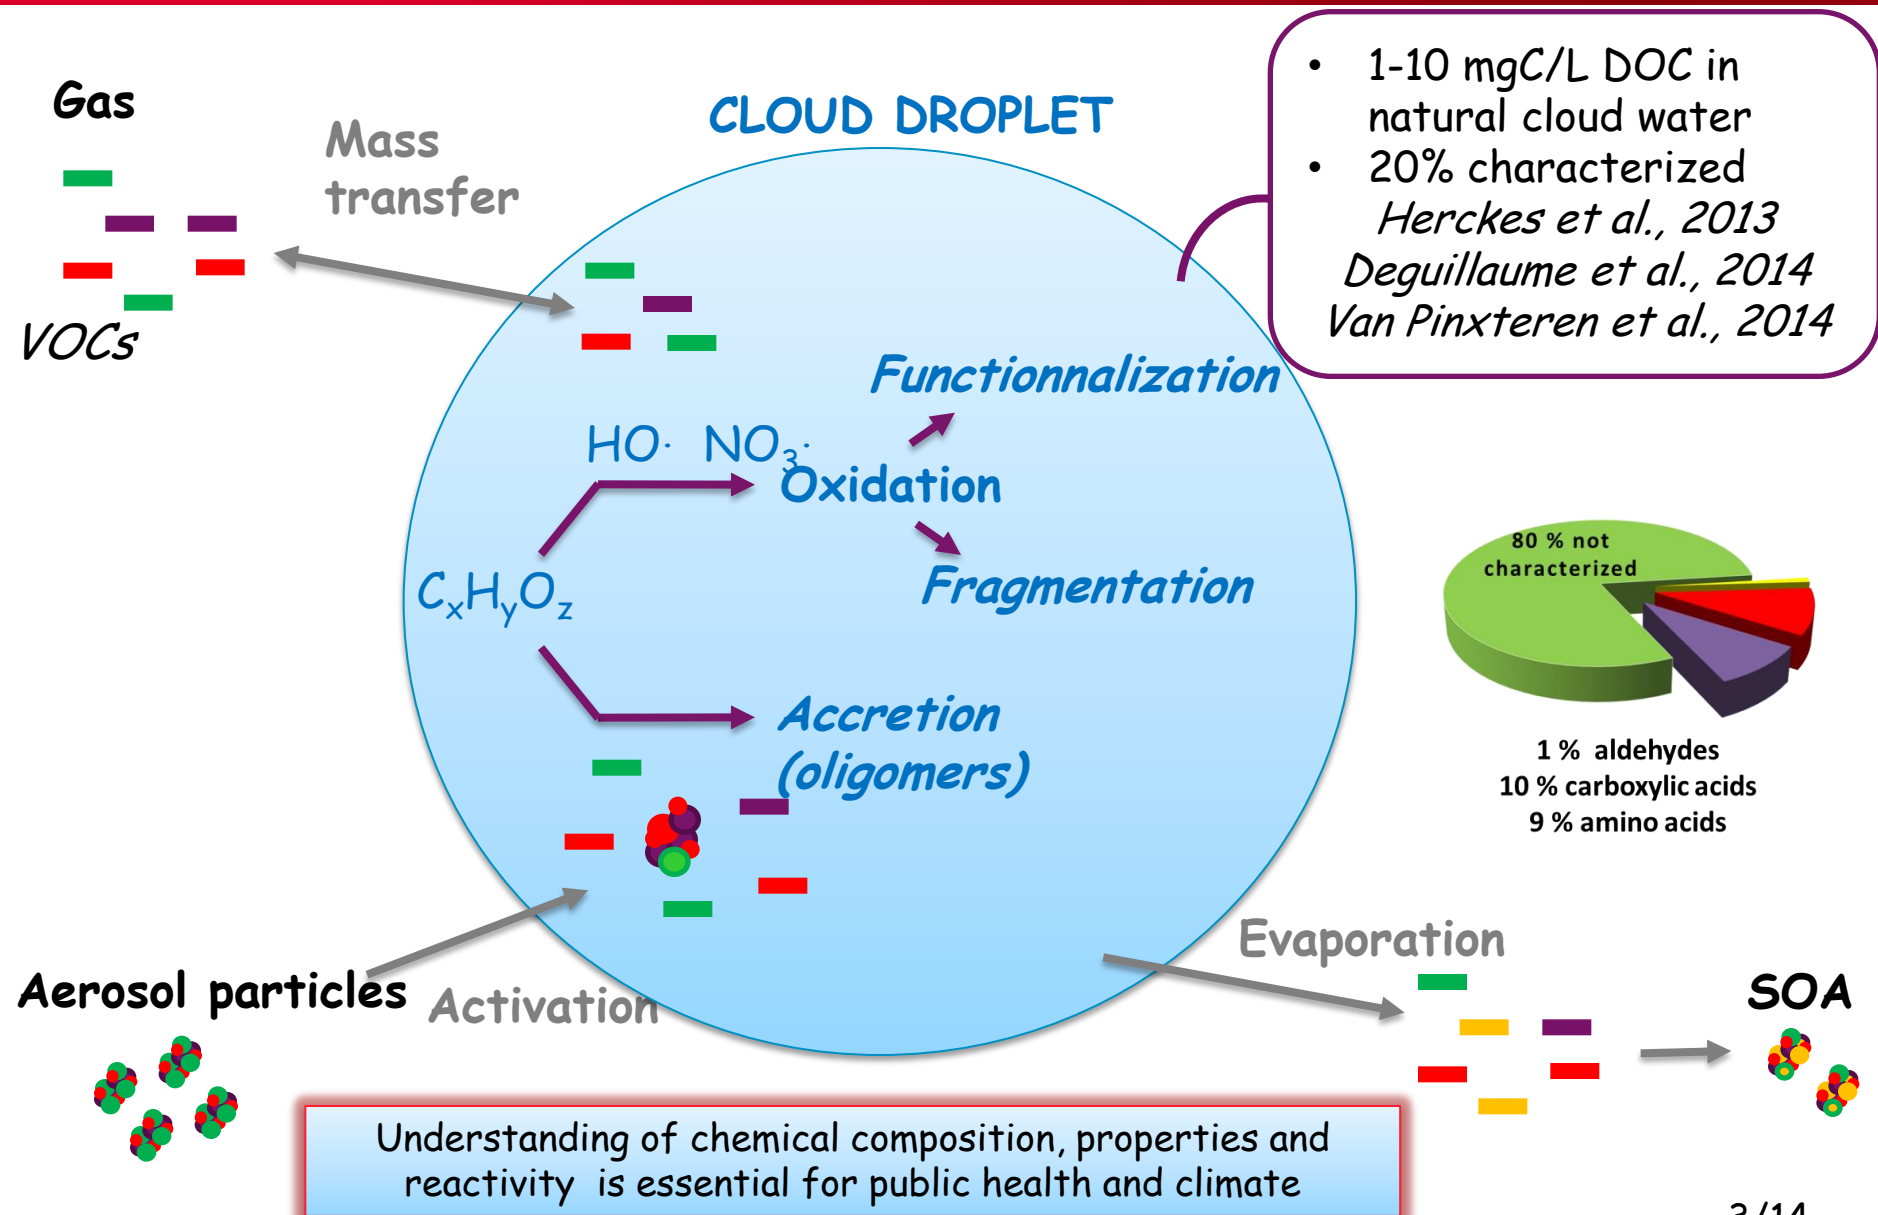

# INTRODUCTION AND CONTEXT OF THE STUDY

## Gas, particles and cloud: global overview of the interactions

# INTRODUCTION AND CONTEXT OF THE STUDY

## Focus on the cloud droplet: chemical reactions

### ➤ Research Goals:

- 1 **Characterization** of water dissolved organic matter at the molecular level (Spatio / temporal variability) / influence of air masses, ...
- 2 **Reactivity** of organic compounds in cloud water
- 3 Study the **synergetic/ antagonistic** effects of photochemistry/biodegradation

puy de Dôme station

1464 m.a.s.l.

ESI

APPI

FTICR (9,4 T)

Impactors

Van Krevelen diagram (commonly used to describe the chemical properties of aerosols)

### Comparison

Sample molecular composition with

- 1 Cloud physico-chemical parameters
- 2 Air mass origin
- 3 Photochemistry
- 4 Microbial activity

Visualization  
of sample composition

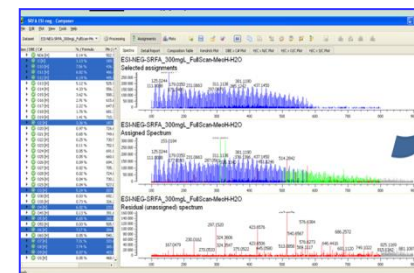

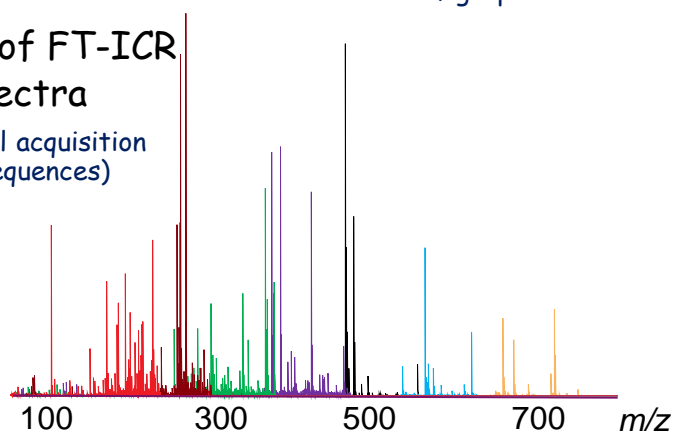

### Composer™

- 1 Data import (*peak list m/z/ Intensity*)
- 2 Internal recalibration of the peak list / assign highly accurate m/z values
- 3 Assign elemental compositions to each peak list and review of chemical class and component abundance
- 4 Visualization of sample composition and comparison of samples through use of graph and tables

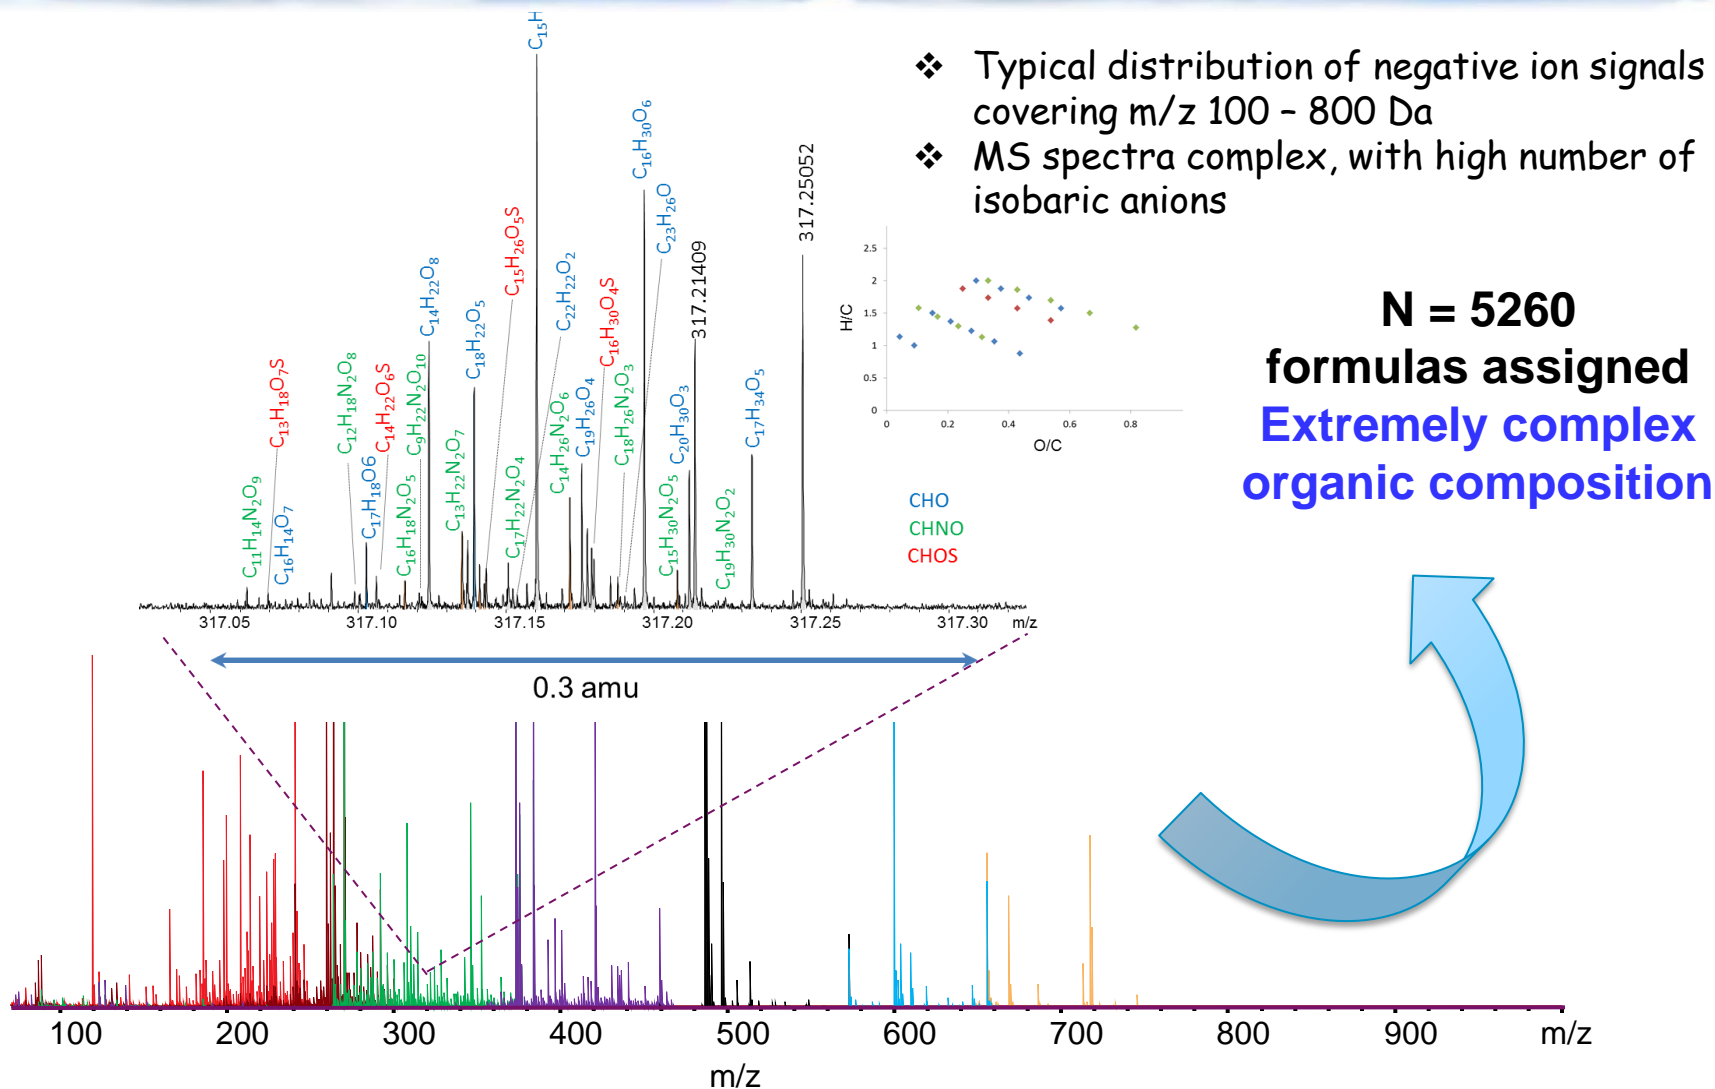

### Data Filtering

- SPE bkd subtraction
- S/N < 3
- MD > 5

Acquisition of FT-ICR  
MS spectra  
Sequential acquisition  
(7 m/z sequences)

- ESI FT/ICR MS spectrum (SPE background subtracted) from 01/06/2017

# RESULTS

## Molecular Class distribution

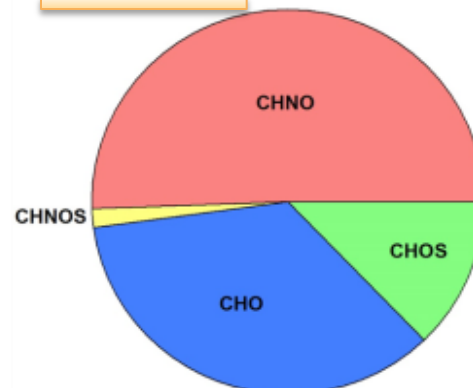

Cloud 01/06/2016 ESI analysis  
5260 molecular formula assigned

% of assigned  
molecular formulae

- 53,5% CHNO
- 21,3 % (CHOS + CHONS)
- 25,2 % CHO

Cloud 02/07/2016 ESI analysis  
2894 molecular formula assigned

- 50,6 % CHNO
- 14,3 % (CHOS + CHONS)
- 35,1 % CHO

- Four subgroups of molecular formulas determined based on their elemental composition
- High abundance of nitrogen containing compounds (over  $\frac{1}{2}$  the compositional space)
- Considerable contribution of sulfur containing organic compounds (in line with other studies of water soluble atmospheric aerosols)

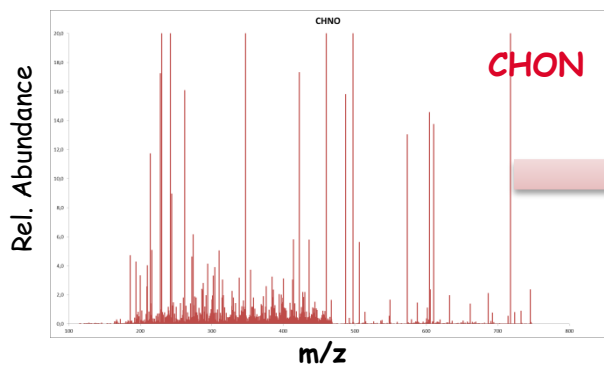

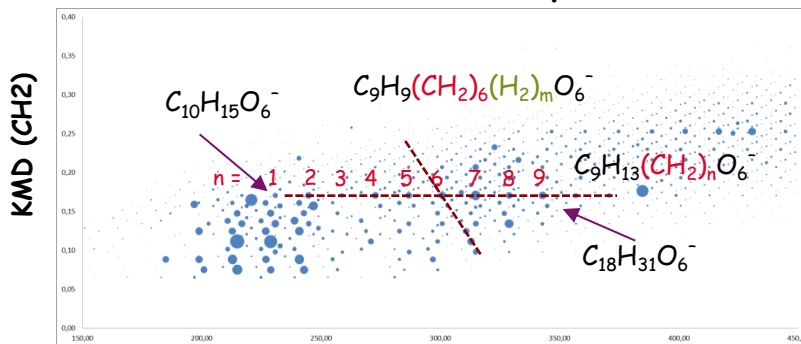

# RESULTS

## Kendrick Mass Defect, (-CH<sub>2</sub>)

Reconstructed Ion Chromatograms

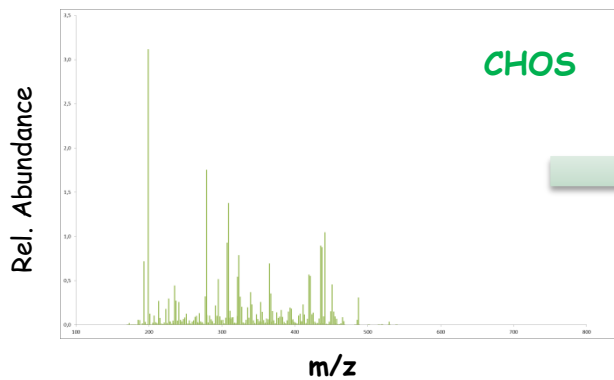

Kendrick mass defect plots

KMD (CH<sub>2</sub>)

❖ « CH<sub>2</sub> » homologous series

KMD (CH<sub>2</sub>)

❖ « CH<sub>2</sub> » homologous series

CHO

CHON

CHOS

CHONS

- ❖ Consistent with those of **biogenic SOA** samples
- ❖ Few condensed aromatic compounds (biomass combustion emissions, pyrolysis of wood lignin) / methoxyphenols have been reported in aqueous SOA (Sun et al. 2010)
- ❖ Average O/C for CHO is  $0.34 \pm 0.20$ , lower than ambient rainwater ( $0.7 \pm 0.5$  Altieri et al. 2009) and clouds collected in Colorado ( $0.5 \pm 0.3$ ), more similar to ambient AWSOC ( $0.4 \pm 0.2$  Mazzoleni et al. 2012)
- ❖ But... maybe SPE bias against low MW, high O/C compounds

- ❖ High density in the « protein » like family
- ❖ Most O/C < 0.5 similar to WSOC and fog AOM (Wozniak et al., 2008; Mazzoleni et al., 2010; Schmidt-Kopplin et al., 2010)
- ❖ Sources of reduced CHNO: mainly wood combustion emission or aqueous phase reactions like the one shown for glyoxal or methyl glyoxal with  $\text{NH}_4\text{NO}_3$  (Galloway et al., 2009, Sareen et al., 2010)

- ❖ High number of highly unsaturated CHOS compounds
- ❖ Most formulas are « compatible » with organosulfates (O content, low DBE values,...) probably originating from secondary reactions (with Sulfuric acid)
- ❖ The reduced S-containing compounds may be from primary emissions (diesel?)

- ❖ Similar pool of condensed, aromatic N and S containing compounds
- ❖ Formulas are compatible with nitrooxy organosulfates

- ❖ Presence of functionalized water-soluble condensed aromatic compounds

- Molecular composition determined by ultrahigh-resolution Fourier-transform ion cyclotron resonance mass spectrometry provides unambiguous identification of the cloud water organic anion composition in the Puy de Dôme area
  - > 5000 monoisotopic molecular formulae found for sample 01/06/2016
  - ~ 3000 molecular formulae found for sample 02/07/2016
- Complex organic compounds containing C, H, N, O, S with MW comprised between m/z 50 and 700 Da
  - significantly more N-containing and S-containing compounds for 01/06/2016
  - Van Krevelen diagrams reveal more unsaturated components from 01/06/2016 sample
